LIST OF TABLES

1. Introduction

The Innovasic Semiconductor IA186EB and IA188EB microcontrollers are form, fit, and function replacements for the original Intel® 80C186EB, 80C188EB, 80L186EB, and 80L188EB 16-bit high-integration embedded processors.

These devices are produced using Innovasic's Managed IC Lifetime Extension System (MILES™). This cloning technology, which produces replacement ICs beyond simple emulations, ensures complete compatibility with the original device, including any "undocumented features." Additionally, the MILES process captures the clone design in such a way that production of the clone can continue even as silicon technology advances.

The IA186EB and IA188EB microcontrollers replace the obsolete Intel 80C186EB and 80C188EB devices, allowing users to retain existing board designs, software compilers/assemblers, and emulation tools, thereby avoiding expensive redesign efforts.

1.1 General Description

The Innovasic Semiconductor IA186EB and IA188EB microcontrollers are an upgrade for the 80C186EB/80C188EB microcontroller designs with integrated peripherals to provide increased functionality and reduce system costs. The IA186EB and IA188EB devices are designed to satisfy requirements of embedded products designed for telecommunications, office automation and storage, and industrial controls.

The IA186EB and IA188EB microcontrollers have a set of base peripherals beneficial to many embedded applications and include a standard numeric interface, an interrupt control unit, a chip-select unit, a DRAM refresh control unit, a power management unit, and three 16-bit timer/counters.

The IA186EB and IA188EB microcontrollers are capable of operating at 5.0 or 3.3 volts. This datasheet discusses both modes of operation. Where applicable, characteristics specific to either 3.3 or 5.0 volt operation are identified separately throughout this datasheet.

Additionally, the IA186EB and IA188EB include two integrated serial ports that support both synchronous and asynchronous communications, simplifying inter-processor and display communications. The IA186EB and IA188EB also have an enhanced chip-select unit and two multiplexed I/O ports. The enhanced chip-select unit offers 10 general chip selects, each with the ability to address up to 1 Mbyte. This enhanced unit enables memory-bank switching to expand the IA186EB/IA188EB 1 Mbyte address space. The I/O ports allow for basic functions such as scanning keypads for input. The ports can also be used to control system power consumption, disabling unneeded components.

The serial ports, I/O capabilities, and enhanced chip selects make the IA186EB/IA188EB an excellent processor for portable data acquisition or communication applications.

1.2 Features

The primary features of the IA186EB and IA188EB microcontrollers are as follows:

- Low-Power Operating Modes
  - Idle (freezes CPU clocks; peripherals are kept active)
  - Power-Down (freezes all internal clocks)
- Low-Power CPU Core (static)
- Direct Addressing Capability
  - Memory: 1 Mbyte
  - I/O: 64 Kbyte
- I/O Ports
  - 2 each, 8-Bit
  - Multiplexed
- Clock Generator
- Chip Selects
  - 10 each, Programmable
  - Integral Wait-State Generator
- Memory Refresh Control Unit
- Interrupt Controller, Programmable
- Counter/Timers
  - 3 each, 16-Bit
  - Programmable
- Serial Channels
  - 2 each, UARTs
  - Integral Baud Rate Generator
- Operating Frequency (system clock input)
  - 50 MHz @ 5V
  - 32 MHz @ 3.3V

Chapter 4, Functional Description, provides details of the IA186EB and IA188EB microcontrollers, including the features listed above.

2. Packaging, Pin Descriptions, and Physical Dimensions

Information on the packages and pin descriptions for the IA186EB and the IA188EB is provided separately. Refer to sections, figures, and tables for information on the device of interest.

2.1 Packages and Pinouts

The Innovasic Semiconductor IA186EB and IA188EB microcontroller is available in the following packages:

- 84-Pin Plastic Leaded Chip Carrier (PLCC), equivalent to original PLCC package
- 80-Pin Plastic Quad Flat Pack (PQFP), equivalent to original PQFP package
- 80-Pin Low-Profile Quad Flat Pack (LQFP), equivalent to original SQFP package

2.1.1 IA186EB 84 PLCC Package

The pinout for the IA186EB 84 PLCC Package is as shown in Figure 1. The corresponding pinout is provided in Table 1.

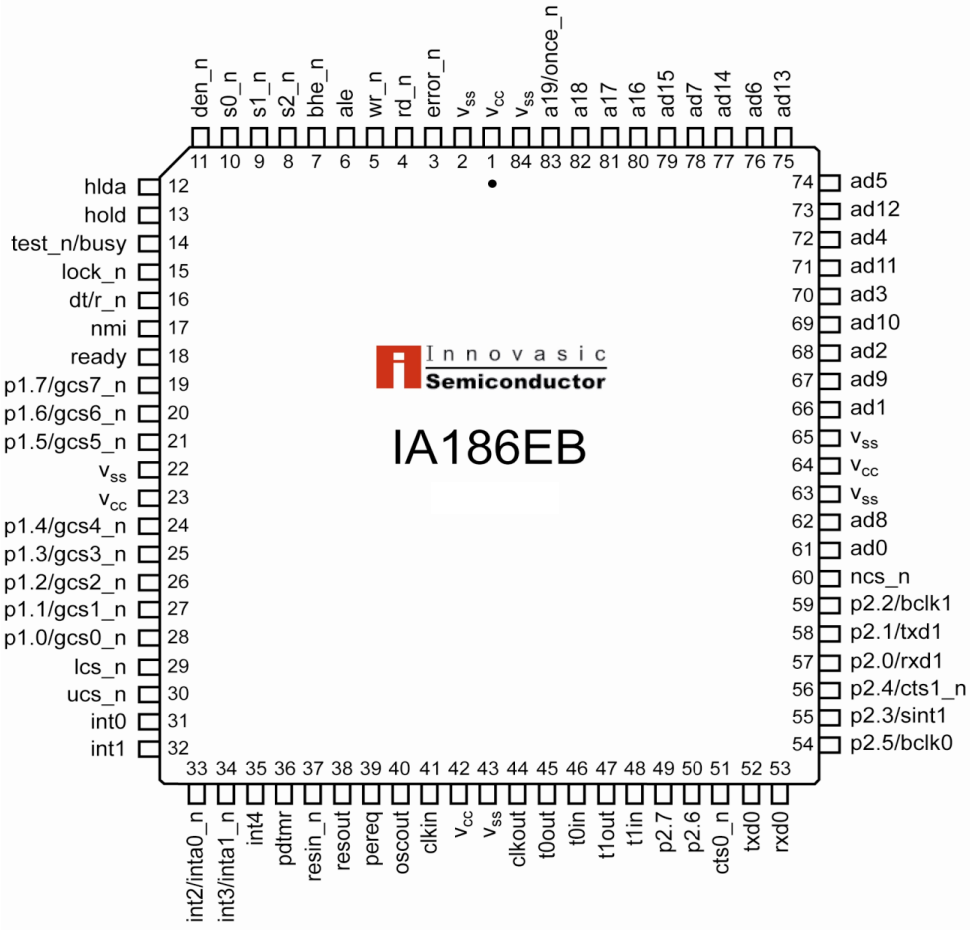

Figure 1. IA186EB 84-Pin PLCC Package Diagram

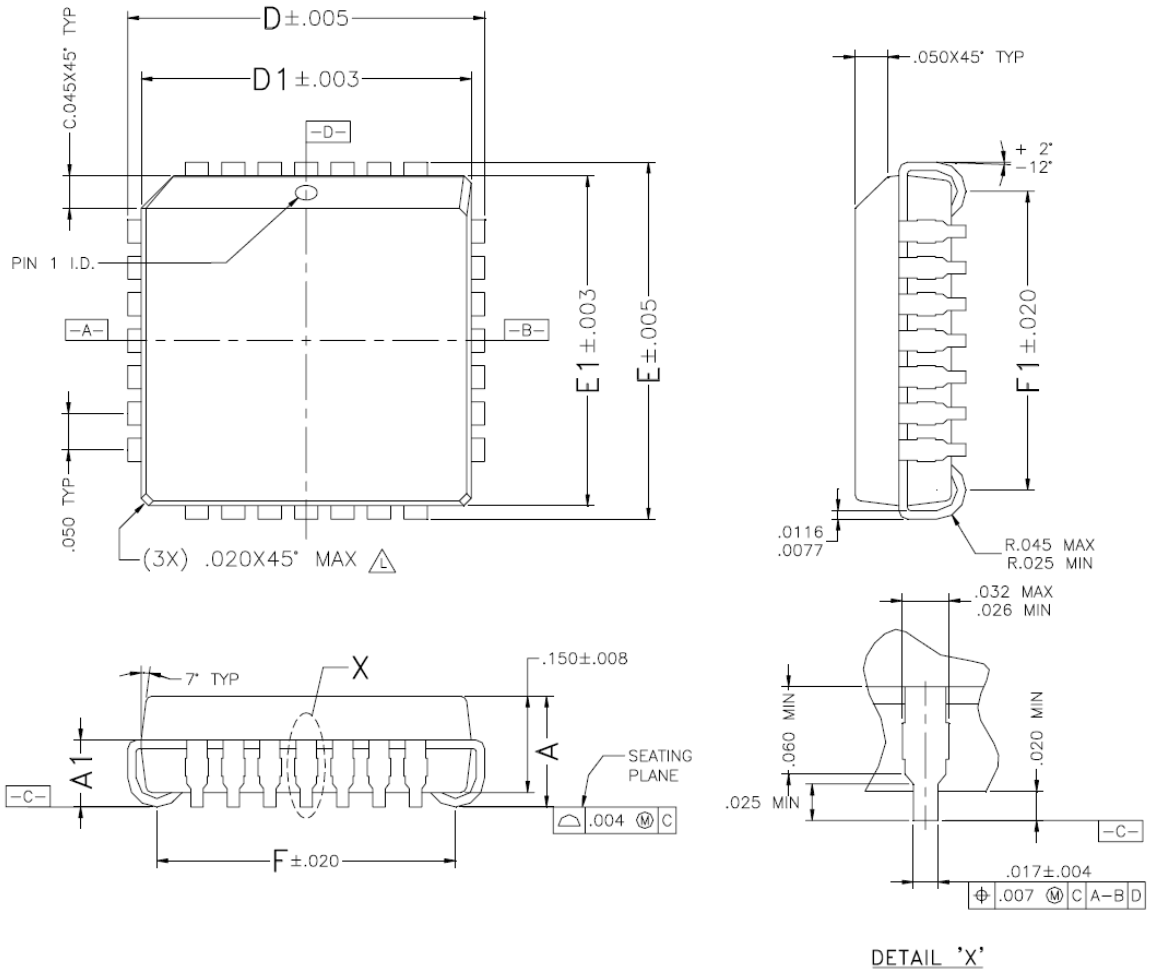
2.1.3 PLCC Physical Dimensions

The physical dimensions for the 84 PLCC are as shown in Figure 3.



Legend:

Symbol	Min	Nom	Max
A	0.165″	–	0.180″
A1	0.090″	–	0.120″
D	–	1.190″	–
D1	–	1.154″	–
E	–	1.190″	–
E1	–	1.154″	–
F	–	1.110″	–
F1	–	1.110″	–

Note: The bottom package is bigger than the top package by 0.004 inches (0.002 inches per side). Bottom package dimensions follow those stated in this drawing.

Figure 3. 84-Pin PLCC Physical Package Dimensions

2.1.4 IA186EB 80 PQFP Package

The pinout for the IA186EB 80 PQFP Package is as shown in Figure 4. The corresponding pinout is provided in Table 3.

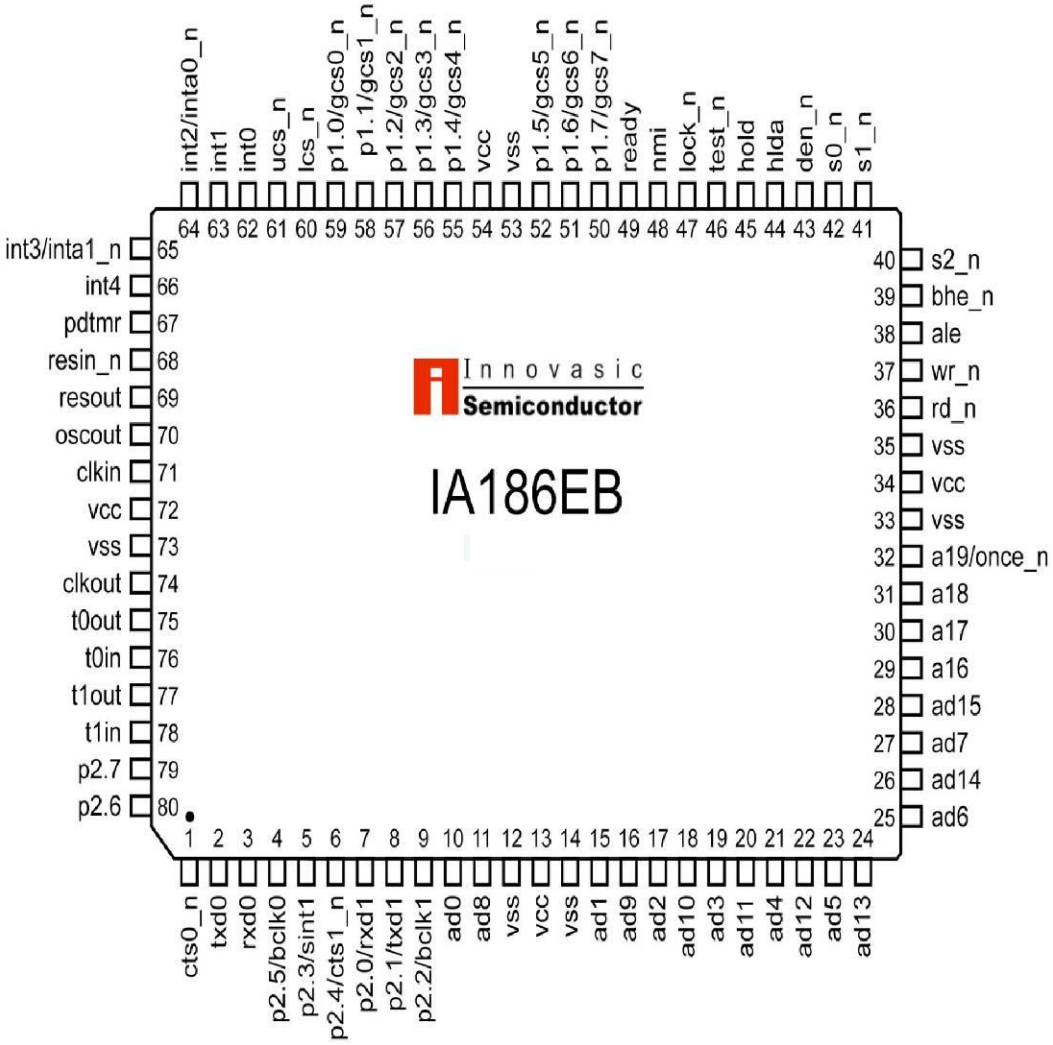


Figure 4. IA186EB 80-Pin PQFP Package Diagram

[a]Alloy 42 L/F.
[b]Copper L/F.

Notes:
1. Dimension D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25mm per side. Dimension D1 and E1 do not include mold mismatch and are determined a datum plane –H–.
2. Dimension b does not include dambar protrusion. Allowable dambar protrusion will not cause the lead width to exceed the maximum b dimension by more than 0.08mm. Dambar cannot be located on the lower radius of the lead foot.

$θ_2$	11°	12°	13°	11°	12°	13°
$θ_3$	11°	12°	13°	11°	12°	13°

1. To be determined at seating plane C.
2. Dimensions D1 and E1 do not include mold protrusion. D1 and E1 are maximum plastic body size dimensions including mold mismatch.
3. Dimension b does not include dambar protrusion. Dambar cannot be located on the lower radius of the foot.
4. Exact shape of each corner is optional.
5. These dimensions apply to the flat section of the lead between 0.10 and 0.25mm from the lead tip.
6. A1 is defined as the distance from the seating plane to the lowest point of the package body.

Notes:
1. Exact shape of each corner is optional.
2. Controlling dimension: mm.

Figure 9. 80-Pin LQFP Physical Package Dimensions

2.2 IA186EB Pin/Signal Descriptions

Descriptions of the pin and signal functions for the IA186EB microcontroller are provided in Table 7.

Several of the IA186EB pins have different functions depending on the operating mode of the device. Each of the different signals supported by a pin is listed and defined in Table 7—indexed alphabetically in the first column of the table. Additionally, the name of the pin associated with the signal as well as the pin numbers for the PLCC, LQFP, and PQFP packages are provided in the "Pin" column. Signals not used in a specific package type are designated "NA."

Table 7. IA186EB Pin/Signal Descriptions

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
a16 (output only)	a16	80	66	29	**a**ddress Bits [**16–19**]. Input/Output. These pins provide the four most-significant bits of the Address Bus. During the address portion of the IA186EB bus cycle, Address Bits [16–19] are presented on the bus and can be latched using the ale signal (see table entry). During the data portion of the IA186EB bus cycle, these lines are driven to a logic 0.
a17 (output only)	a17	81	67	30	
a18 (output only)	a18	82	68	31	
a19	**a19**/once_n	83	69	32	
ad0	ad0	61	47	10	**a**ddress/**d**ata Bits [**0–15**]. Input/Output. These pins provide the multiplexed Address Bus and Data Bus. During the address portion of the IA186EB bus cycle, Address Bits [0–15] are presented on the bus and can be latched using the ale signal (see next table entry). During the data portion of the IA186EB bus cycle, 8- or 16-bit data are present on these lines.
ad1	ad1	66	52	15	
ad2	ad2	68	54	17	
ad3	ad3	70	56	19	
ad4	ad4	72	58	21	
ad5	ad5	74	60	23	
ad6	ad6	76	62	25	
ad7	ad7	78	64	27	
ad8	ad8	62	48	11	
ad9	ad9	67	53	16	
ad10	ad10	69	55	18	
ad11	ad11	71	57	20	
ad12	ad12	73	59	22	
ad13	ad13	75	61	24	
ad14	ad14	77	63	26	
ad15	ad15	79	65	28	

Table 7. IA186EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
ale	ale	6	75	38	**a**ddress **l**atch **e**nable. Output. Active High. This signal is used to latch the address information during the address portion of a bus cycle.
bclk0	p2.5/**bclk0**	54	41	4	**b**aud **cl**oc**k**, Serial Port **0**. Input. The **bclk0** pin can be used to provide an alternate clock source for Serial Port 0. The input clock rate cannot be greater than one-half the operating frequency of the IA186EB.
bclk1	p2.2/**bclk1**	59	46	9	**b**aud **cl**oc**k**, Serial Port **1**. Input. The **bclk1** pin can be used to provide an alternate clock source for Serial Port 1. The input clock rate cannot be greater than one-half the operating frequency of the IA186EB.
bhe_n bhe_n is multi-plexed with refresh_n	bhe_n bhe_n is multi-plexed with refresh_n	7	76	39	**b**yte **h**igh **e**nable. Output. Active Low. When **bhe_n** is asserted (low), it indicates that the bus cycle in progress is transferring data over the upper half of the data bus. Additionally, **bhe_n** and **ad0** encode the following bus information: ad0 bhe_n Bus Status 0 0 Word Transfer 0 1 Even Byte Transfer 1 0 Odd Byte Transfer 1 1 Refresh Operation Note: bhe_n is multiplexed with refresh_n.
busy	test_n/**busy**	14	NA	NA	**busy**. Input. Active High. When the **busy** input is asserted, it causes the IA186EB to suspend operation during the execution of the Intel 80C187 Numerics Coprocessor instructions. Operation resumes when the pin is sampled low. *This applies to the PLCC package only.*

Table 7. IA186EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
clkin	clkin	41	28	71	**cl**oc**k in**put. Input. The **clkin** pin is the input connection for an external clock. An external oscillator operating at two times the required processor operating frequency can be connected to this pin. If a crystal is used to supply the clock, it is connected between the **clkin** pin and the **oscout** pin (see oscout table entry). When a crystal is connected, it drives an internal Pierce oscillator to the IA186EB.
clkout	clkout	44	31	74	**cl**oc**k out**put. Output. The **clkout** pin provides a timing reference for inputs and outputs of the IA186EB. This clock output is one-half the input clock (**clkin**) frequency. The **clkout** signal has a 50% duty cycle, transitioning every falling edge of **clkin**.
cts0_n	cts0_n	51	38	1	**c**lear **t**o **s**end, Serial Port **0**. Input. Active Low. When this input is high (i.e., not asserted), data transmission from Serial Port 0 is inhibited. When the signal is asserted (low), data transmission is permitted.
cts1_n	p2.4/**cts1_n**	56	43	6	**c**lear **t**o **s**end, Serial Port **1**. Input. Active Low. When this input is high (i.e., not asserted), data transmission from Serial Port 1 is inhibited. When the signal is asserted (low), data transmission is permitted.
den_n	den_n	11	80	43	**d**ata **en**able. Output. Active Low. This signal is used to enable of bidirectional transceivers in a buffered system. The **den_n** signal is asserted (low) only when data is to be transferred on the bus.
dt/r_n	dt/r_n	16	NA	NA	**d**ata **t**ransmit/**r**eceive. Output. This signal is used to control the direction of data flow for bidirectional buffers in a buffered system. When **dt/r_n** is high, the direction indicated is transmit; when **dt/t_n** is low, the direction indicated is receive.
error_n	error_n	3	NA	NA	**error**. Input. Active Low. When this signal is asserted (low), it indicates that the last numerics coprocessor operation resulted in an exception condition.

Table 7. IA186EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
gcs0_n	p1.0/**gcs0_n**	28	16	59	**g**eneric **c**hip **s**elect **n** (n = 0–7). Output. Active Low. When programmed and enabled, each of these pins provide a chip select signal that will be asserted (low) whenever the address of a memory or I/O bus cycle is within the address space programmed for that output.
gcs1_n	p1.1/**gcs1_n**	27	15	58	
gcs2_n	p1.2/**gcs2_n**	26	14	57	
gcs3_n	p1.3/**gcs3_n**	25	13	56	
gcs4_n	p1.4/**gcs4_n**	24	12	55	
gcs5_n	p1.5/**gcs5_n**	21	9	52	
gcs6_n	p1.6/**gcs6_n**	20	8	51	
gcs7_n	p1.7/**gcs7_n**	19	7	50	
hlda	hlda	12	1	44	**h**o**ld** **a**cknowledge. Output. Active High. When **hlda** is asserted (high), it indicates that the IA186EB has relinquished control of the local bus to another bus master in response to a HOLD request (see next table entry). When **hlda** is asserted, the IA186EB data bus and control signals float, allowing another bus master to drive the signals directly.
hold	hold	13	2	45	**hold**. Input. Active High. This signal is a request indicating that an external bus master wishes to gain control of the local bus. The IA186EB will relinquish control of the local bus between instruction boundaries not conditioned by a LOCK prefix.
int0 (input)	int0 (input only)	31	19	62	**interrupt n** (n = 0-4). Input/Output. Active High. These maskable inputs interrupt program flow and cause execution to continue at an interrupt vector of a specific interrupt type as follows: **int0**: Type 12 **int1**: Type 13 **int2**: Type 14 **int3**: Type 15 **int4**: Type 17 To allow interrupt expansion, **int0** and **int1** can be used with the interrupt acknowledge signals **inta0_n** and **inta1_n** (see next table entries) to serve as external interrupt inputs or interrupt acknowledge outputs.
int1 (input)	int1 (input only)	32	20	63	
int2	**int2**/inta0_n	33	21	64	
int3	**int3**/inta1_n	34	22	65	
int4 (input)	int4 (input only)	35	23	66	
inta0_n	int2/**inta0_n**	33	21	64	**int**errupt **a**cknowledge **0**. Input/Output. Active Low. This pin provides an interrupt acknowledge handshake in response to an interrupt request on the **int0** pin (see previous table entry).

Table 7. IA186EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
inta1_n	int3/**inta1_n**	34	22	65	**int**errupt **a**cknowledge **1**. Input/Output. Active Low. This pin provides an interrupt acknowledge handshake in response to an interrupt request on the **int1** pin (see previous table entry).
lcs_n	lcs_n	29	17	60	**l**ower **c**hip **s**elect. Output. Active Low. This pin provides a chip select signal that will be asserted (low) whenever the address of a memory bus cycle is within the address space programmed for that output.
lock_n	lock_n	15	4	47	**lock**. Output. Active Low. When asserted (low), this signal indicates that the bus cycle in progress is cannot be interrupted. While **lock_n** is active, the IA186EB will not service bus requests such as HOLD.
ncs_n	ncs_n	60	NA	NA	**n**umerics **c**oprocessor **s**elect. Output. Active Low. This signal is asserted (low) when the IA186EB accesses an Intel 80C187 Numerics Coprocessor.
nmi	nmi	17	5	48	**n**on-**m**askable **i**nterrupt. Input. Active High. When the **nmi** signal is asserted (high) it causes a Type 2 interrupt to be serviced by the IA186EB. Note: The assertion of **nmi** is latched internally by the IA186EB.
once_n	a19/**once_n**	83	69	32	**on**-**c**ircuit **e**mulation. Input. Active Low. Note: ONCE Mode is used for device testing. If the **once_n** pin is driven low during a reset operation, all IA186EB output and input/output pins are placed in a high-impedance state. This pin is weakly held high while **resin_n** is active.

Table 7. IA186EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
oscout	oscout	40	27	70	**osc**illator **out**put. Output. The **oscout** pin is the output connection for an external crystal that drives the IA186EB internal Pierce oscillator. (When an external crystal is used, it is connected between this pin and the **clkin** pin. See **clkin** table entry.) Note: If an external oscillator or clock source is used to drive the IA186EB instead of a crystal, **oscout** must be left unconnected (i.e., must float). When the IA186EB is operating in the ONCE mode, **oscout** does not float.
p1.0	**p1.0**/gcs0_n	28	16	59	**p**ort **1**, Bit [N] (N = **0**–**7**). Output. Each pin of Port 1, **p1.0**–**p1.7**, can function individually as a general-purpose output line.
p1.1	**p1.1**/gcs1_n	27	15	58	
p1.2	**p1.2**/gcs2_n	26	14	57	
p1.3	**p1.3**/gcs3_n	25	13	56	
p1.4	**p1.4**/gcs4_n	24	12	55	
p1.5	**p1.5**/gcs5_n	21	9	52	
p1.6	**p1.6**/gcs6_n	20	8	51	
p1.7	**p1.7**/gcs7_n	19	7	50	
p2.0	**p2.0**/rxd1	57	44	7	**p**ort **2**, Bit [**0**]. Input/Output. This pin functions as a general-purpose I/O line.
p2.1	**p2.1**/txd1	58	45	8	**p**ort **2**, Bit [**1**]. Output. This pin functions as a general-purpose output line.
p2.2	**p2.2**/bclk1	59	46	9	**p**ort **2**, Bit [**2**]. Input. This pin functions as a general-purpose input line.
p2.3	**p2.3**/sint1	55	42	5	**p**ort **2**, Bit [**3**]. Output. This pin functions as a general-purpose output line.
p2.4	**p2.4**/cts1_n	56	43	6	**p**ort **2**, Bit [**4**]. Input. This pin functions as a general-purpose input line.
p2.5	**p2.5**/bclk0	54	41	4	**p**ort **2**, Bit [**5**]. Input. This pin functions as a general-purpose input line.
p2.6	p2.6	50	37	80	**p**ort **2**, Bit [**6**]. Input/Output (open drain). This pin functions as a general-purpose bidirectional input/output line.
p2.7	p2.7	49	36	79	**p**ort **2**, Bit [**7**]. Input/Output (open drain). This pin functions as a general-purpose bidirectional input/output line.

Table 7. IA186EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
pdtmr	pdtmr	36	24	67	**p**ower-**d**own **tim**e**r**. Input/Output (push-pull). Note: The IA186EB enters Powerdown Mode when the PWRDN bit in the Power Control Register is set to 1 and a HALT instruction is executed. Exit from the Powerdown Mode occurs upon receipt of a non-maskable interrupt (i.e., assertion of the **nmi** input) or a reset (i.e., assertion of the **resin_n** input). The **pdtmr** pin, which is normally connected to an external capacitor, determines the amount of time that the IA186EB waits before resuming normal operation after an exit from the Powerdown when a non-maskable interrupt is received—essentially a delay between the assertion of the **nmi** input and the enabling of the IA186EB internal clocks. The delay required depends on the start-up characteristics of the crystal oscillator. The **pdtmr** pin does not apply when the Powerdown Mode is exited by the receipt of a reset (i.e., the assertion **resin_n**).
pereq	pereq	39	NA	NA	numerics co**p**rocessor **e**xternal **req**uest. Input. Active High. When asserted (high), this signal indicates that a data transfer between an Intel 80C187 Numerics Coprocessor.and memory is pending. *This applies to the PLCC only.*
rd_n	rd_n	4	73	36	**r**ea**d**. Output. Active Low. When asserted (low), **rd_n** indicates that the accessed memory or I/O device must drive data from the location being accessed onto the data bus.
ready	ready	18	6	49	**ready**. Input. Active High. When asserted (high) the **ready** line indicates a bus-cycle completion. This signal must be active to terminate any bus cycle unless the IA186EB Chip-Select Unit is configured to ignore ready.
resin_n	resin_n	37	25	68	**res**et **in**put. Input. Active Low. When **resin_n** is asserted (low), the IA186EB immediately terminates any bus cycle in progress and assumes an initialized state. All pins are driven to a known state, and **resout** (see next table entry) is asserted.

Table 7. IA186EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
resout	resout	38	26	69	**res**et **out**put. Output. Active High. When **resout** is asserted, it indicates that the IA186EB is being reset. The **resout** signal will remain active (high) as long as **resin_n** remains active (low).
rxd0	rxd0	53	40	3	Receive (**rx**) **d**ata, Serial Port **0**. Input/Output. This pin is the serial data input for Serial Port 0. During synchronous serial communications, **rxd0** is bidirectional and functions an output for data transmission (**txd0** becomes the clock).
rxd1	p2.0/**rxd1**	57	44	7	Receive (**rx**) **d**ata, Serial Port **1**. Input/Output. This pin is the serial data input for Serial Port 1. During synchronous serial communications, **rxd1** is bidirectional and functions an output for data transmission (**txd1** becomes the clock).
s0_n	s0_n	10	79	42	**s**tatus**N** (**N** = 0–2). Output. During a bus cycle the status (i.e., type) of cycle is encoded on these lines as follows: **s2_n** **s1_n** **s0_n** Bus Cycle Status 0 0 0 Interrupt Acknowledge 0 0 1 Read I/O 0 1 0 Write I/O 0 1 1 Processor HALT 1 0 0 Queue Instruction Fetch 1 0 1 Read Memory 1 1 0 Write Memory 1 1 1 No Bus Activity
s1_n	s1_n	9	78	41	
s2_n	s2_n	8	77	40	
sint1	p2.3/**sint1**	55	42	5	**s**erial **int**errupt, Serial Port **1**. Output. Active High. When **sint1** is asserted (high), it indicates that Serial Port 1 requires service.
t0in	t0in	46	33	76	**t**imer **0 in**put. Input. Depending on the Timer Mode programmed for Timer 0, this input is used either as clock input or a control signal.
t0out	t0out	45	32	75	**t**imer **0 out**put. Output. Depending on the Timer Mode programmed for Timer 0, this output can provide a single clock or a continuous waveform.
t1in	t1in	48	35	78	**t**imer **1 in**put. Input. Depending on the Timer Mode programmed for Timer 1, this input is used either as clock input or a control signal.

Table 7. IA186EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
t1out	t1out	47	34	77	**t**imer **1 out**put. Output. Depending on the Timer Mode programmed for Timer 1, this output can provide a single clock or a continuous waveform.
test_n	**test_n**/busy	14	3	46	**test**. Input. Active Low. When the **test_n** input is high (i.e., not asserted), it causes the IA186EB to suspend operation during the execution of the WAIT instruction. Operation resumes when the pin is sampled low (asserted).
txd0	txd0	52	39	2	Transmit (**tx**) **d**ata, Serial Port **0**. Output. This pin is the serial data output for Serial Port 0. During synchronous serial communications, **txd0** becomes the transmit clock (**rxd0** functions as an output for data transmission).
txd1	p2.1/**txd1**	58	45	8	Transmit (**tx**) **d**ata, Serial Port **1**. Output. This pin is the serial data output for Serial Port 1. During synchronous serial communications, **txd1** becomes the transmit clock (**rxd1** functions as an output for data transmission).
ucs_n	ucs_n	30	18	61	**u**pper **c**hip **s**elect. Output. Active Low. This pin provides a chip select signal that will be asserted (low) whenever the address of a memory bus cycle is within the address space programmed for that output.
V_{CC}	V_{CC}	1, 23, 42, 64	11, 29, 50, 71	13, 34, 54, 72	Power (**V_{CC}**). This pin provides power for the IA186EB device. It must be connected to a +5V DC power source.
V_{SS}	V_{SS}	2, 22, 43, 63, 65, 84	10, 30, 49, 51, 70, 72	12, 14, 33, 35, 53, 73	Ground (**V_{SS}**). This pin provides the digital ground (0V) for the IA186EB. It must be connected to a V_{SS} board plane.
wr_n	wr_n	5	74	37	**wr**ite. Output. Active Low. When asserted (low), **wr_n** indicates that data available on the data bus are to be latched into the accessed memory or I/O device.

2.3 IA188EB Pin/Signal Descriptions

Descriptions of the pin and signal functions for the IA188EB microcontroller are provided in Table 8.

Several of the IA188EB pins have different functions depending on the operating mode of the device. Each of the different signals supported by a pin is listed and defined in Table 8—indexed alphabetically in the first column of the table. Additionally, the name of the pin associated with the signal as well as the pin numbers for the PLCC, LQFP, and LQFP packages are provided in the "Pin" column.

Table 8. IA188EB Pin/Signal Descriptions

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
a8	a8	62	48	11	**a**ddress Bits [**8-19**]. Output. These pins provide the 12 most-significant bits of the Address Bus. During the entire IA188EB bus cycle, Address Bits [8–19] are presented on the bus and can be latched using the **ale** signal (see table entry).
a9	a9	67	53	16	
a10	a10	69	55	18	
a11	a11	71	57	20	
a12	a12	73	59	22	
a13	a13	75	61	24	
a14	a14	77	63	26	
a15	a15	79	65	28	
a16	a16	80	66	29	
a17	a17	81	67	30	
a18	a18	82	68	31	
a19	**a19**/once_n	83	69	32	
ad0	ad0	61	47	10	**a**ddress/**d**ata Bits [**0**–**7**]. Input/Output. These pins provide a multiplexed Address Bus and Data Bus. During the address portion of the IA188EB bus cycle, Address Bits [0–7] are presented on the bus and can be latched using the **ale** signal (see next table entry). During the data portion of the IA188EB bus cycle, 8-bit data are present on these lines.
ad1	ad1	66	52	15	
ad2	ad2	68	54	17	
ad3	ad3	70	56	19	
ad4	ad4	72	58	21	
ad5	ad5	74	60	23	
ad6	ad6	76	62	25	
ad7	ad7	78	64	27	
ale	ale	6	75	38	**a**ddress **l**atch **e**nable. Output. Active High. This signal is used to latch the address information during the address portion of a bus cycle.
bclk0	p2.5/**bclk0**	54	41	4	**b**aud **cl**oc**k**, Serial Port **0**. Input. The **bclk0** pin can be used to provide an alternate clock source for Serial Port 0. The input clock rate cannot be greater than one-half the operating frequency of the IA188EB.

Table 8. IA188EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
bclk1	p2.2/**bclk1**	59	46	9	**b**aud **c**lo**c**k, Serial Port **1**. Input. The **bclk1** pin can be used to provide an alternate clock source for Serial Port 1. The input clock rate cannot be greater than one-half the operating frequency of the IA188EB.
clkin	clkin	41	28	71	**c**lo**c**k **in**put. Input. The **clkin** pin is the input connection for an external clock. An external oscillator, operating at two times the required processor operating frequency, can be connected to this pin. If a crystal is used to supply the clock, it is connected between the **clkin** pin and the **oscout** pin (see **oscout** table entry). When a crystal is connected, it drives an internal Pierce oscillator to the IA188EB.
clkout	clkout	44	31	74	**c**lo**c**k **out**put. Output. The **clkout** pin provides a timing reference for inputs and outputs of the IA188EB. This clock output is one-half the input clock (**clkin**) frequency. The **clkout** signal has a 50% duty cycle, transitioning every falling edge of **clkin**.
cts0_n	cts0_n	51	38	1	**c**lear **t**o **s**end, Serial Port **0**. Input. Active Low. When this input is high (i.e., not asserted), data transmission from Serial Port 0 is inhibited. When the signal is asserted (low), data transmission is permitted.
cts1_n	p2.4/**cts1_n**	56	43	6	**c**lear **t**o **s**end, Serial Port **1**. Input. Active Low. When this input is high (i.e., not asserted), data transmission from Serial Port 1 is inhibited. When the signal is asserted (low), data transmission is permitted.
den_n	den_n	11	80	43	**d**ata **en**able. Output. Active Low. This signal is used to enable of bidirectional transceivers in a buffered system. The **den_n** signal is asserted (low) only when data are to be transferred on the bus.
dt/r_n	dt/r_n	16	NA	NA	**d**ata **t**ransmit**/r**eceive. Output. This signal is used to control the direction of data flow for bidirectional buffers in a buffered system. When **dt/r_n** is high, the direction indicated is transmit; when **dt/t_n** is low, the direction indicated is receive.

Table 8. IA188EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
gcs0_n	p1.0/**gcs0_n**	28	16	59	**g**eneric **c**hip **s**elect **n** (n = 0–7). Output. Active Low. When programmed and enabled, each of these pins provide a chip select signal that will be asserted (low) whenever the address of a memory or I/O bus cycle is within the address space programmed for that output.
gcs1_n	p1.1/**gcs1_n**	27	15	58	
gcs2_n	p1.2/**gcs2_n**	26	14	57	
gcs3_n	p1.3/**gcs3_n**	25	13	56	
gcs4_n	p1.4/**gcs4_n**	24	12	55	
gcs5_n	p1.5/**gcs5_n**	21	9	52	
gcs6_n	p1.6/**gcs6_n**	20	8	51	
gcs7_n	p1.7/**gcs7_n**	19	7	50	
hlda	hlda	12	1	44	**h**o**ld** **a**cknowledge. Output. Active High. When **hlda** is asserted (high), it indicates that the IA188EB has relinquished control of the local bus to another bus master in response to a HOLD request (see next table entry). When **hlda** is asserted, the IA188EB data bus and control signals are floated, allowing another bus master to drive the signals directly.
hold (input)	hold (input)	13	2	45	**hold**. Input. Active High. This signal is a request indicating that an external bus master wishes to gain control of the local bus. The IA188EB will relinquish control of the local bus between instruction boundaries not conditioned by a lock prefix.
int0 (input)	int0 (input only)	31	19	62	**int**errupt N (N = **0**–**4**). Input/Output. Active High. These maskable inputs interrupt program flow and cause execution to continue at an interrupt vector of a specific interrupt type as follows: **int0**: Type 12 **int1**: Type 13 **int2**: Type 14 **int3**: Type 15 **int4**: Type 17 To allow interrupt expansion, **int0** and **int1** can be used with the interrupt acknowledge signals **inta0_n** and **inta1_n** (see next table entries) to serve as external interrupt inputs or interrupt acknowledge outputs.
int1 (input)	int1 (input only)	32	20	63	
int2	**int2**/inta0_n	33	21	64	
int3	**int3**/inta1_n	34	22	65	
int4 (input)	int4 (input only)	35	23	66	
inta0_n	int2/**inta0_n**	33	21	64	**int**errupt **a**cknowledge **0**. Output. Active Low. This pin provides an interrupt acknowledge handshake in response to an interrupt request on the **int0** pin (see previous table entry).

Table 8. IA188EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
inta1_n	int3/**inta1_n**	34	22	65	**int**errupt **a**cknowledge **1**. Input/Output. Active Low. This pin provides an interrupt acknowledge handshake in response to an interrupt request on the **int1** pin (see previous table entry).
lcs_n	lcs_n	29	17	60	**l**ower **c**hip **s**elect. Input/Output. Active Low. This pin provides a chip select signal that will be asserted (low) whenever the address of a memory bus cycle is within the address space programmed for that output.
lock_n	lock_n	15	4	47	**lock**. Output. Active Low. When asserted (low), this signal indicates that the bus cycle in progress is cannot be interrupted. While **lock_n** is active, the IA188EB will not service bus requests such as HOLD.
nmi	nmi	17	5	48	**n**on-**m**askable **i**nterrupt. Input. Active High. When the **nmi** signal is asserted (high), it causes a Type 2 interrupt to be serviced by the IA188EB. Note: The assertion of **nmi** is latched internally by the IA188EB.
once_n	a19/**once_n**	83	69	32	**on**-**c**ircuit **e**mulation. Input. Active Low. Note: ONCE Mode is used for device testing. If the **once_n** pin is driven low during reset, all IA188EB output and input/output pins are placed in a high-impedance state. This pin is weakly held high while **resin_n** is active.
oscout	oscout	40	27	70	**osc**illator **out**put. Output. The **oscout** pin is the output connection for an external crystal that drives the IA188EB internal Pierce oscillator. (When an external crystal is used, it is connected between this pin and the **clkin** pin—see **clkin** table entry.) Note: If an external oscillator or clock source is used to drive the IA188EB instead of a crystal, **oscout** must be left unconnected (i.e., must float). When the IA188EB is operating in the ONCE mode, **oscout** does not float.

p1.7	**p1.7**/gcs7_n	19	7	50	
p2.0	**p2.0**/rxd1	57	44	7	**p**ort **2**, Bit [**0**]. Input/Output. This pin functions as a general-purpose I/O line.
p2.1	**p2.1**/txd1	58	45	8	**p**ort **2**, Bit [**1**]. Output. This pin functions as a general-purpose output line.
p2.2	**p2.2**/bclk1	59	46	9	**p**ort **2**, Bit [**2**]. Input. This pin functions as a general-purpose input line.
p2.3	**p2.3**/sint1	55	42	5	**p**ort **2**, Bit [**3**]. Output. This pin functions as a general-purpose output line.
p2.4	**p2.4**/cts1_n	56	43	6	**p**ort **2**, Bit [**4**]. Input. This pin functions as a general-purpose input line.
p2.5	**p2.5**/bclk0	54	41	4	**p**ort **2**, Bit [**5**]. Input. This pin functions as a general-purpose input line.
p2.6	p2.6	50	37	80	**p**ort **2**, Bit [**6**]. Input/Output (open drain). This pin functions as a general-purpose bidirectional input/output line.
p2.7	p2.7	49	36	79	**p**ort **2**, Bit [**7**]. Input/Output (open drain). This pin functions as a general-purpose bidirectional input/output line.

Table 8. IA188EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
pdtmr	pdtmr	36	24	67	**P**ower-**d**own **tim**e**r**. Input/Output (push-pull). Note: The IA188EB enters Powerdown Mode when the PWRDN bit in the Power Control Register is set to 1 and a HALT instruction is executed. Exit from the Powerdown Mode occurs upon receipt of a non-maskable interrupt (i.e., assertion of the **nmi** input) or a reset (i.e., assertion of the **resin_n** input). The **pdtmr** pin, which is normally connected to an external capacitor, determines the amount of time that the IA188EB waits before resuming normal operation after an exit from the Powerdown when a non-maskable interrupt is received—essentially a delay between the assertion of the **nmi** input and the enabling of the IA188EB internal clocks. The delay required depends on the start-up characteristics of the crystal oscillator. The **pdtmr** pin does not apply when the Powerdown Mode is exited by the receipt of a reset (i.e., the assertion **resin_n**).
rd_n	rd_n	4	73	36	**r**ea**d**. Output. Active Low. When asserted (low), **rd_n** indicates that the accessed memory or I/O device must drive data from the location being accessed onto the data bus.
ready	ready	18	6	49	**ready**. Input. Active High. When asserted (high) the **ready** line indicates the completion of a bus cycle. This signal must be active to terminate any bus cycle unless the IA188EB Chip-Select Unit is configured to ignore ready.
resin_n	resin_n	37	25	68	**res**et **in**put. Input. Active Low. When **resin_n** is asserted (low), the IA188EB immediately terminates any bus cycle in progress and assumes an initialized state. All pins are driven to a known state, and **resout** (see next table entry) is asserted.
resout	resout	38	26	69	**res**et **out**put. Output. Active High. When **resout** is asserted, it indicates that the IA188EB is being reset. The **resout** signal will remain active (high) as long as **resin_n** remains active (low).
rfsh_n	rfsh_n	7	76	39	**r**e**f**re**sh**. Output. Active Low. When **rfsh_n** is asserted (low), it indicates that a refresh cycle is in progress.

Table 8. IA188EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
rxd0	rxd0	53	40	3	Receive (**rx**) **d**ata, Serial Port **0**. Input/Output. This pin is the serial data input for Serial Port 0. During synchronous serial communications, **rxd0** is bidirectional and functions an output for data transmission (**txd0** becomes the clock).
rxd1	p2.0/**rxd1**	57	44	7	Receive (**rx**) **d**ata, Serial Port **1**. Input/Output. This pin is the serial data input for Serial Port 1. During synchronous serial communications, **rxd1** is bidirectional and functions an output for data transmission (**txd1** becomes the clock).
s0_n	s0_n	10	79	42	**s**tatus**N** (N = 0–2). Output. During a bus cycle the status (i.e., type) of cycle is encoded on these lines as follows: **s2_n** **s1_n** **s0_n** Bus Cycle Status 0 0 0 Interrupt Acknowledge 0 0 1 Read I/O 0 1 0 Write I/O 0 1 1 Processor HALT 1 0 0 Queue Instruction Fetch 1 0 1 Read Memory 1 1 0 Write Memory 1 1 1 No Bus Activity
s1_n	s1_n	9	78	41	
s2_n	s2_n	8	77	40	
sint1	p2.3/**sint1**	55	42	5	**s**erial **int**errupt, Serial Port **1**. Output. Active High. When **sint1** is asserted (high), it indicates that Serial Port 1 requires service.
t0in	t0in	46	33	76	**t**imer **0 in**put. Input. Depending on the Timer Mode programmed for Timer 0, this input is used either as clock input or a control signal.
t0out	t0out	45	32	75	**t**imer **0 out**put. Output. Depending on the Timer Mode programmed for Timer 0, this output can provide a single clock or a continuous waveform.
t1in	t1in	48	35	78	**t**imer **1 in**put. Input. Depending on the Timer Mode programmed for Timer 1, this input is used either as clock input or a control signal.
t1out	t1out	47	34	77	**t**imer **1 out**put. Output. Depending on the Timer Mode programmed for Timer 1, this output can provide a single clock or a continuous waveform.

Table 8. IA188EB Pin/Signal Descriptions *(Continued)*

Signal	Pin				Description
	Name	PLCC	LQFP	PQFP	
test_n	test_n	14	3	46	**test**. Input. Active Low. When the **test_n** input is high (i.e., not asserted), it causes the IA188EB to suspend operation during the execution of the WAIT instruction. Operation resumes when the pin is sampled low (asserted).
txd0	txd0	52	39	2	Transmit (**tx**) **d**ata, Serial Port **0**. Output. This pin is the serial data output for Serial Port 0. During synchronous serial communications, **txd0** becomes the transmit clock (**rxd0** functions as an output for data transmission).
txd1	p2.1/txd1	58	45	8	Transmit (**tx**) **d**ata, Serial Port **1**. Output. This pin is the serial data output for Serial Port 1. During synchronous serial communications, **txd1** becomes the transmit clock (**rxd1** functions as an output for data transmission).
ucs_n	ucs_n	30	18	61	**u**pper **c**hip **s**elect. Output. Active Low. This pin provides a chip select signal that will be asserted (low) whenever the address of a memory bus cycle is within the address space programmed for that output.
V_{CC}	V_{CC}	1, 23, 42, 64	11, 29, 50, 71	13, 34, 54, 72	Power ($\mathbf{V_{CC}}$). This pin provides power for the IA188EB device. It must be connected to a +5V DC power source.
V_{SS}	V_{SS}	2, 22, 43, 63, 65, 84	10, 30, 49, 51, 70, 72	12, 14, 33, 35, 53, 73	Ground ($\mathbf{V_{SS}}$). This pin provides the digital ground (0V) for the IA188EB. It must be connected to a $\mathbf{V_{SS}}$ board plane.
wr_n	wr_n	5	74	37	**wr**ite. Output. Active Low. When asserted (low), **wr_n** indicates that data available on the data bus are to be latched into the accessed memory or I/O device.

3. Maximum Ratings, Thermal Characteristics, and DC Parameters

For the Innovasic Semiconductor IA186EB and IA188EB microcontrollers, the absolute maximum ratings, thermal characteristics, and DC parameters are provided in Tables 9 through 11, respectively.

Table 9. IA186EB and IA188EB Absolute Maximum Ratings

Parameter	Rating
Storage Temperature	−40°C to +125°C
Supply Voltage with Respect to v_{ss}	−0.3V to +6.0V
Voltage on Pins other than Supply with Respect to v_{ss}	−0.3V to +(Vcc + 0.3)V

Table 10. IA186EB and IA188EB Thermal Characteristics

Symbol	Characteristic	Value	Units
T_A	Ambient Temperature	-40°C to 85°C	°C
P_D	Power Dissipation	MHz × ICC × V/1000	W
Θ_{Ja}	84-Pin PLCC Package	30.7	°C/W
	80-Pin PQFP Package	46	
	80-Pin LQFP Package	52	
T_J	Average Junction Temperature	$T_A + (P_D \times \Theta_{Ja})$	°C

Table 11. IA186EB and IA188EB DC Parameters

Symbol	Parameter	Min	Max	Units	Notes
5.0V Operation V_{CC}	Supply Voltage	4.5	5.5	V	–
3.3V Operation V_{CC}	Supply Voltage	3.0	3.6	V	–
V_{IL}	Input Low Voltage	−0.3	0.3 V_{CC}	V	input hysteresis on resin_n = 0.50V
V_{IH}	Input High Voltage	0.7 V_{CC}	V_{CC} + 0.3	V	–
V_{OL}	Output Low Voltage Vcc = 5.5V or 3.6V	–	0.4	V	I_{OL} = 12mA
V_{OH}	Output High Voltage Vcc = 4.5V/3.0V	3.5/2.4	–	V	I_{OH} = −12 mA
I_{LEAK}	Input Leakage Current for Pins: ad15–ad0, ad7–ad0 (IA188EB), ready, hold, resin_n; clkin, test_n, nmi, int4–int0, t0in, t1in, rdx0, bclk0_n, cts0_n, rxd1, bclk1_n, cts1_n, p2.6, p2.7	–	± 1	µA	0V ≤ V_{IN} ≤ V_{CC}
	Input Leakage Current for Pins (@3.3V): pereq	+ .147	+.625	mA	V_{IN} = V_{CC}
	Input Leakage Current for Pins (@3.3V): a19/once_n, a18–a16, lock_n, error_n	− .147	−.625	mA	V_{IN} =0V
	Input Leakage Current for Pins (@5V): pereq	+ .227	+.833	mA	V_{IN} = V_{CC}
	Input Leakage Current for Pins (@5V): a19/once_n, a18–a16, lock_n, error_n	− .227	−.833	mA	V_{IN} =0V
I_{LO}	Output Leakage Current	–	± 10	µA	0.45 ≤ V_{OUT} ≤ V_{CC}
I_{ID}	Supply Current (IDLE) - @ 50 MHz	–	90	mA	–
C_{IN}	Input Pin Capacitance	0	5	pF	T_F = 1 MHz
C_{OUT}	Output Pin Capacitance	0	5	pF	T_F = 1 MHz
Operating temperature is -40°C to +85°C.					

4. Functional Description

4.1 Device Architecture

Architecturally, the IA186EB and IA188EB microcontrollers include the following functional modules:

- Bus Interface Unit
- Clock Generator
- Interrupt Control Unit
- Timer/Counter Unit
- Serial Communications Unit
- Chip-Select Unit
- I/O Port Unit
- Refresh Control Unit
- Power Management Unit

A functional block diagram of the IA186EB/IA188EB is shown in Figure 10. Descriptions of the functional modules are provided in the following subsections.

4.1.1 Bus Interface Unit

The IA186EB/IA188EB bus controller that generates local bus control signals and uses a hold/hlda protocol to share the local bus with other bus masters. The bus controller generates 20 address bits, read and write control signals, and bus-cycle status information. A ready input is used to extend a bus cycle beyond the minimum four clock cycles.

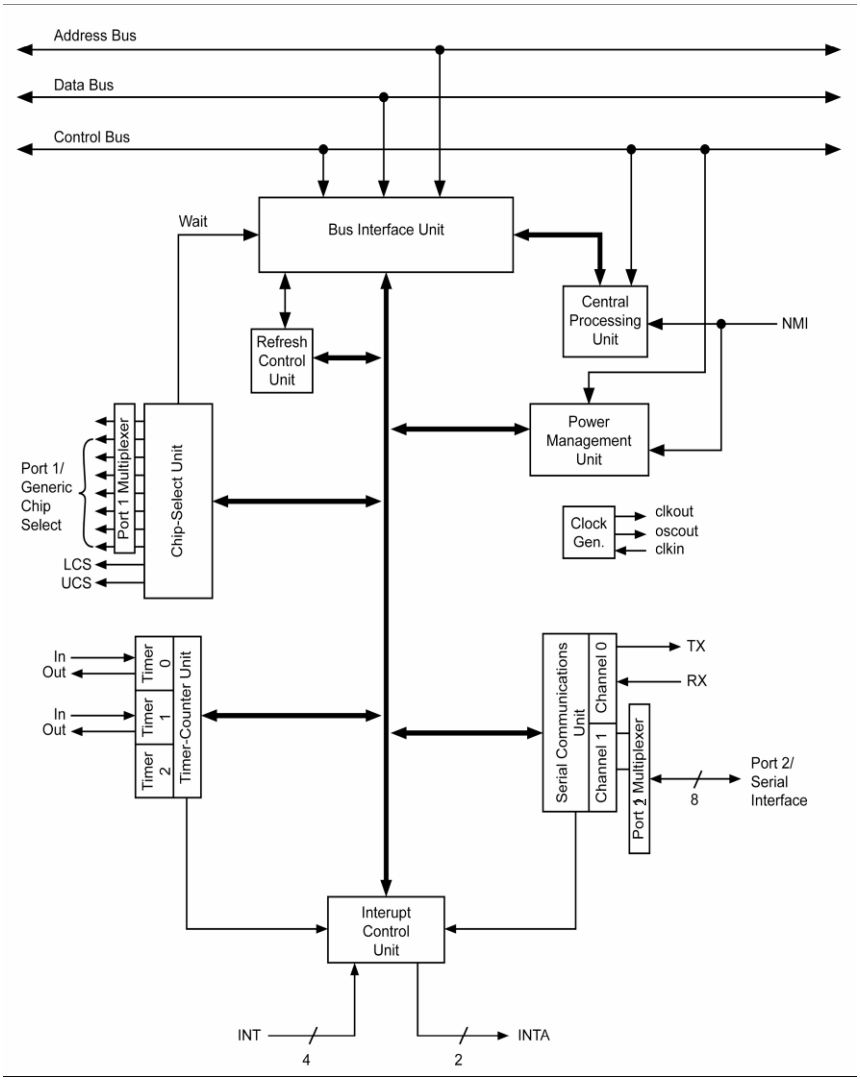

Figure 10. IA186EB/IA188EB Functional Block Diagram

4.1.2 Clock Generator

The IA186EB/IA188EB uses an on-chip clock generator to supply internal and external clocks. The clock generator makes use of a crystal oscillator and includes a divide-by-two counter.

Figure 11 shows the various operating modes of the clock circuit. The clock circuit can use either a parallel resonant fundamental mode crystal network (A) or a third-overtone mode crystal network (B), or it can be driven by an external clock source (C).

The following parameters are recommended when choosing a crystal:

- Temperature Range
  - Application Specific
  - ESR (Equivalent Series Resistance): 40Ω max
  - C0 (Shunt Capacitance of Crystal): 7.0 pF max
  - CL (Load Capacitance): 20 pF ± 2 pF
  - Drive Level: 1 mW max

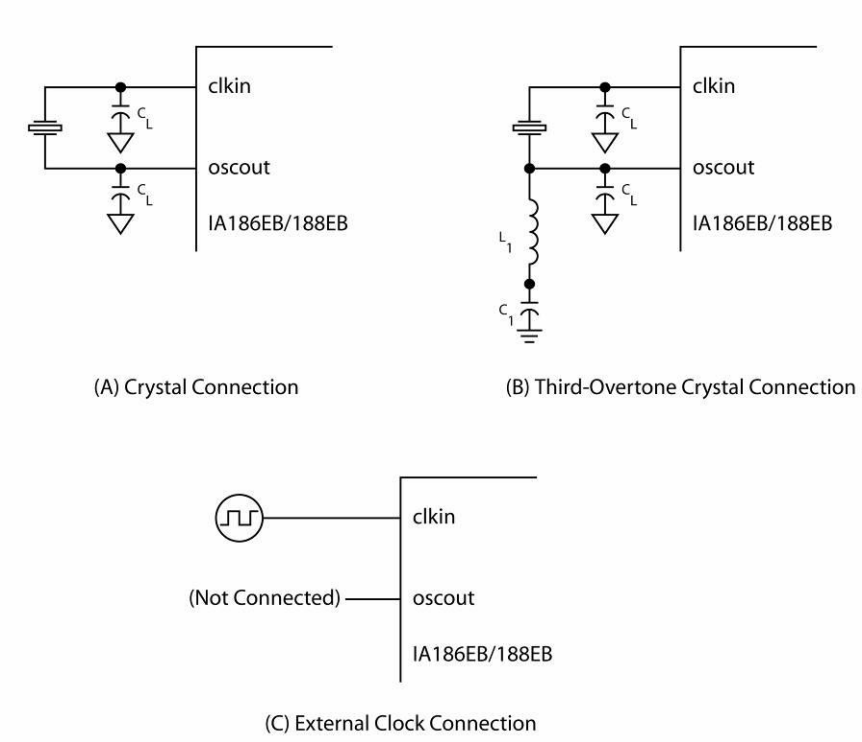

Figure 11. Clock Circuit Connection Options

4.1.3 Interrupt Control Unit

The IA186EB/IA188EB can receive interrupts from a number of sources, both internal and external. The interrupt control unit serves to merge these requests on a priority basis, for individual service by the CPU. Each interrupt source can be independently masked by the Interrupt Control Unit (ICU) or all interrupts can be globally masked by the CPU.

Internal interrupt sources include the Timers and Serial Channel 0. External interrupt sources come from the five input pins int0–int4. The NMI interrupt pin is not controlled by the ICU and is passed directly to the CPU. Although the Timer and Serial channel each have only one request input to the ICU, separate vector types are generated to service individual interrupts within the Timer and Serial channel units.

4.1.4 Timer/Counter Unit

The IA186EB/IA188EB Timer/Counter Unit (TCU) provides three 16-bit programmable timers. Two of these are highly flexible and are connected to external pins for control or clocking. A third timer is not connected to any external pins and can only be clocked internally. However, it can be used to clock the other two timer channels. The TCU can be used to count external events, time external events, generate non-repetitive waveforms, and generate timed interrupts, etc.

4.1.5 Serial Communications Unit

The Serial Control Unit (SCU) of the IA186EB/IA188EB contains two independent channels. Each channel is identical in operation except that only Channel 0 is supported by the integrated interrupt controller (Channel 1 has an external interrupt pin). Each channel has its own baud rate generator that is independent of the Timer/Counter Unit, and can be internally or externally clocked at up to one half the IA186EB/IA188EB operating frequency.

Independent baud rate generators are provided for each of the serial channels. For the asynchronous modes, the generator supplies an 8x baud clock to both the receive and transmit register logic. A 1x baud clock is provided in the synchronous mode.

4.1.6 Chip-Select Unit

The IA186EB/IA188EB Chip-Select Unit (CSU) integrates logic that provides up to ten programmable chip-selects to access both memories and peripherals. In addition, each chip select can be programmed to automatically insert additional clocks (wait-states) into the current bus cycle and automatically terminate a bus cycle independent of the condition of the ready input pin.

4.1.7 I/O Port Unit

The I/O Port Unit (IPU) on the IA186EB/IA188EB supports two 8-bit channels of input, output, or input/output operation. Port 1 is multiplexed with the chip select pins and is output only. Most of Port 2 is multiplexed with the serial channel pins.

4.1.8 Refresh Control Unit

The Refresh Control Unit (RCU) automatically generates a periodic memory read bus cycle to keep dynamic or pseudo-static memory refreshed. A 9-bit counter controls the number of clocks between refresh requests.

A 12-bit address generator is maintained by the RCU and is presented on the a1–a12 address lines during the refresh bus cycle. Address Bits [a13–a19] are programmable to allow the refresh address block to be located on any 8-Kbyte boundary.

4.1.9 Power Management Unit

The IA186EB/IA188EB Power Management Unit (PMU) is provided to control the power consumption of the device. The PMU provides three power modes: Active, Idle, and Powerdown.

Active Mode indicates that all units on the IA186EB/IA188EB are functional and the device consumes maximum power (depending on the level of peripheral operation). Idle Mode freezes the clocks of the execution and bus units at a logic zero state (all peripherals continue to operate normally).

The Powerdown mode freezes all internal clocks at a logic zero level and disables the crystal oscillator. All internal registers hold their values provided V_{CC} is maintained. Current consumption is reduced to just transistor junction leakage.

4.2 Peripheral Architecture

The IA186EB/IA188EB has integrated several common system peripherals with a CPU core to create a compact, yet powerful system. The integrated peripherals are designed to be flexible and provide logical interconnections between supporting units (e.g., the interrupt control unit supports interrupt requests from the timer/counters or serial channels). The list of integrated peripherals includes:

- 7-Input Interrupt Control Unit
- 3-Channel Timer/Counter Unit
- 2-Channel Serial Communications Unit
- 10-Output Chip-Select Unit
- I/O Port Unit
- Refresh Control Unit

- Power Management Unit

The registers associated with each integrated peripheral are contained within a 128 × 16 register file called the Peripheral Control Block (PCB). The PCB can be located in either memory or I/O space on any 256-byte address boundary.

Table 12 provides a list of the registers associated with the PCB.

Table 12. Peripheral Control Block Registers

Note:

[1]The **Step ID** register (offset 0xBC) for Revision 2 of the Innovasic device is read-only, and is uniquely identified in software by having a value of 0x0080. The original Intel device established a value between 0x0000 and 0x0002, depending on the revision of the part.

4.3 Reference Documents

Additional information on the operation and programming of the 80C186EB/80C188EB can be found in the following Intel publications:

- 80C186EB/80C188EB and 80L186EB/80L188EB 16-Bit High-Integration Embedded Processors (272433-006)
- 80C186EB/80C188EB Microprocessor User's Manual (270830-00n)

5. AC Specifications

This chapter defines the AC specifications of the IA186EB/IA188EB. Input characteristics are provided in Figure 12 and Tables 13 and 14. Output characteristics are provided in Figure 13 and Tables 15 and 16. Relative timing characteristics are provided in Figure 14 and Table 17. Clock input and clock output timing characteristics are provided in Figure 18 and Tables 18 and 19. Additional timing information is provided in Chapter 7, Bus Timing, and Chapter 8, Instruction Execution Times.

The following test conditions were used to derive the values in Tables 13 – 16: Rev. 0 was tested at 100C and 4.75V; Rev. 2 was tested at 100C and 4.5V.

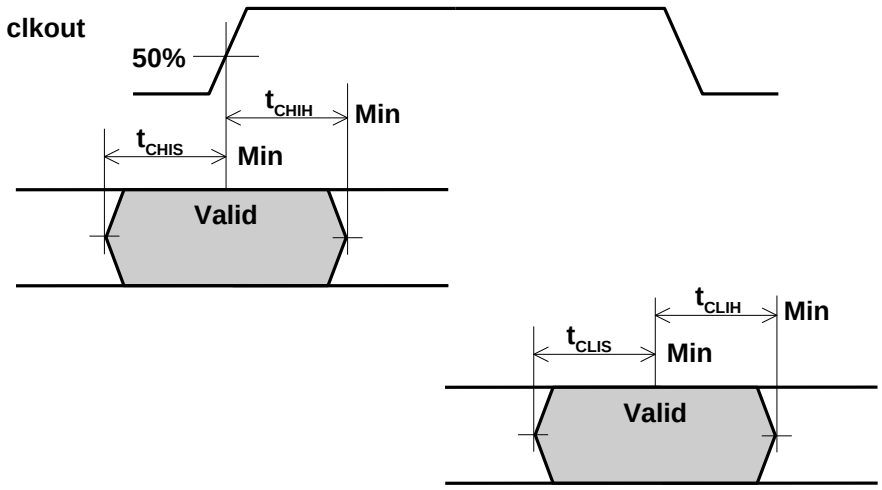

Figure 12. AC Input Characteristics

For specific 5.0- and 3.3-volt characteristics, refer to Tables 13 and 14, respectively.

5.1 AC Test Conditions

The AC specifications are tested with the 50-pF load shown in Figure 15. Specifications are measured at the $V_{CC}/2$ crossing point unless otherwise specified.

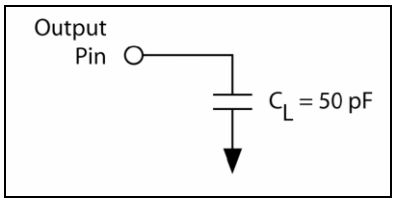

Figure 15. AC Test Load

5.2 Clock Input and Clock Output Timing Characteristics

For clock input and clock output timing characteristics for both 5.0- and 3.3-volt operation, see Tables 18 and 19, respectively.

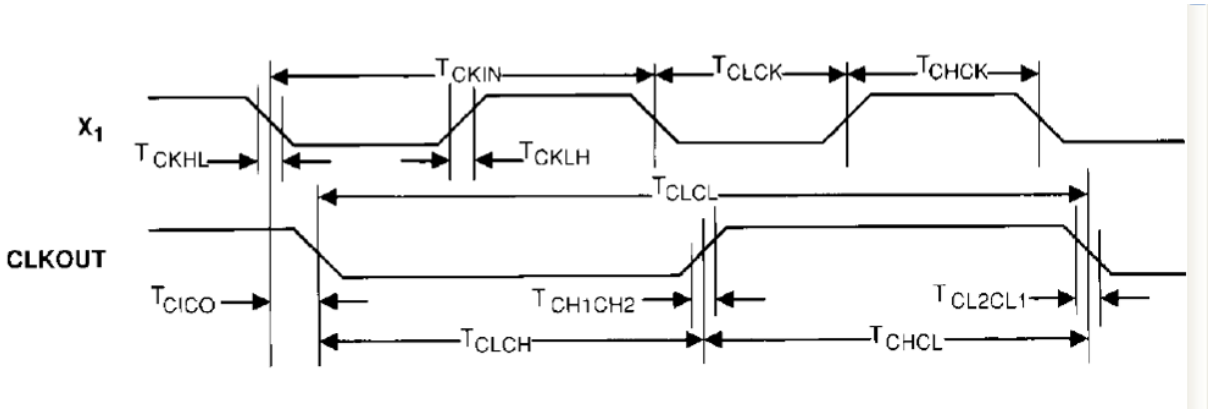

Figure 16. Clock Input and Clock Output Timing Characteristics

Table 18. Clock Input and Clock Output Timing Characteristics for 5.0-Volt Operation

Item	Symbol	Parameter	Min	Max	Units	Notes
–	XTF	clkin Frequency	0	50	MHz	–
1	TCKIN	clkin Period	20	∞	ns	–
2	TCHCK	clkin High Time	10	∞	ns	Measure for VIH for high time, NIL for low time.
3	TCLCK	clkin Low Time	10	∞	ns	Measure for VIH for high time, NIL for low time.
4	TCKLH	clkin Rise Time	1	5	ns	Only required to guarantee ICC. Maximum limits are bounded for TC, TCH, and TCL.
5	TCKHL	clkin Fall Time	1	5	ns	Only required to guarantee ICC. Maximum limits are bounded for TC, TCH, and TCL.
6	TCICO	clkin to clkout Delay	0	11.5	ns	Specified for a 50-pF load.
7	TCLCL	clkout Period	–	2TCKIN	ns	–
8	TCHCL	clkout High Time	(TCLCL/2) – 5	(TCLCL/2) + 5	ns	Measure for VIH for high time, NIL for low time.
9	TCCCH	clkout Low Time	(TCLCL/2) – 5	(TCLCL/2) + 5	ns	Measure for VIH for high time, NIL for low time.
10	TCH1CH2	clkout Rise Time	1	6	ns	Specified for a 50-pF load.
11	TCL2CL1	clkout Fall Time	1	6	ns	Specified for a 50-pF load.

Table 19. Clock Input and Output Characteristics for 3.3-Volt Operation

Item	Symbol	Parameter	Min	Max	Units	Notes

1	TC	clkin Period	30	∞	ns	–
2	TCH	clkin High Time	15	∞	ns	Measure for VIH for high time, NIL for low time.
3	TCL	clkin Low Time	15	∞	ns	Measure for VIH for high time, NIL for low time.
4	TCR	clkin Rise Time	1	5	ns	Only required to guarantee ICC. Maximum limits are bounded for TC, TCH and TCL.
5	TCF	clkin Fall Time	1	5	ns	Only required to guarantee ICC. Maximum limits are bounded for TC, TCH and TCL.
6	XTCD	clkin to clkout Delay	0	14.5	ns	Specified for a 50-pF load.
7	T	clkout Period	–	2TC	ns	–
8	TPH	clkout High Time	(T/2) – 5	(T/2) + 5	ns	Measure for VIH for high time, NIL for low time.
9	TPL	clkout Low Time	(T/2) – 5	(T/2) + 5	ns	Measure for VIH for high time, NIL for low time.
10	TPR	clkout Rise Time	1	6	ns	Specified for a 50-pF load.
11	TPF	clkout Fall Time	1	6	ns	Specified for a 50-pF load.

5.3 Serial Port Mode 0 Timing Characteristics

Serial Port Mode 0 timing characteristics are illustrated in Figure 17 and collected in Table 20.

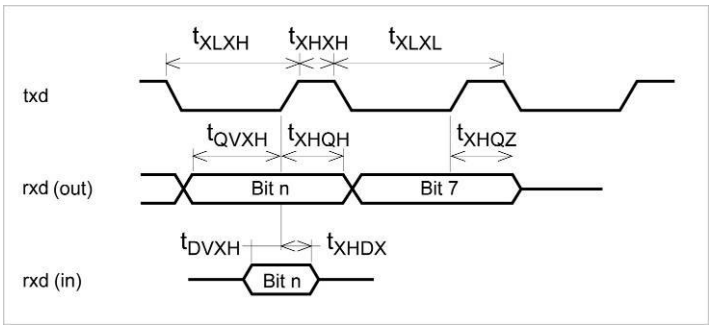

Figure 17. Serial Port Mode 0 Timing Characteristics

Table 20. Serial Port Mode 0 Timing Characteristics

Symbol	Parameter	Minimum	Maximum	Units
t_{XLXL}	txd Clock Period	t (n +1)	–	ns
t_{XLXH}	txd Clock Low to Clock High (n > 1)	2t – 35	2t + 35	ns
t_{XLXH}	txd Clock Low to Clock High (n = 1)	t – 35	t + 35	ns
t_{XHXL}	txd Clock High to Clock Low (n > 1)	(n – 1) t – 35	(n – 1) t + 35	ns
t_{XHXL}	txd Clock High to Clock Low (n = 1)	t – 35	t + 35	ns
t_{QVXH}	rxd Output Data Setup to txd Clock High (n > 1)	(n – 1) t – 35	–	ns
t_{QVXH}	rxd Output Data Setup to txd Clock High (n = 1)	t – 35	–	ns
t_{XHQX}	rxd Output Data Hold after txd Clock High (n > 1)	2t – 35	–	ns
t_{XHQX}	rxd Output Data Hold after txd Clock High (n = 1)	t – 35	–	ns
t_{XHQZ}	rxd Output Data Float after Last txd Clock High	–	t + 20	ns
t_{DVXH}	rxd Input Data Setup to txd Clock High	t + 20	–	ns
t_{XHDX}	rxd Input Data Hold after txd Clock High	0	–	ns

6. Reset Operation

The IA186EB/IA188EB will perform a reset operation any time the resin_n pin is active. Figure 18 shows the reset sequence when power is applied to the IA186EB/IA188EB. An external clock connected to clkin must not exceed the V_{CC} threshold being applied to the processor. This is normally not a problem if the clock driver is supplied with the same V_{CC} that supplies the processor. When attaching a crystal to the device, resin_n must remain active until both V_{CC} and clkout are stable (the length of time is application-specific and depends on the startup characteristics of the crystal circuit). The resin_n pin is designed to operate correctly using an RC reset circuit, but the designer must ensure that the ramp time for V_{CC} is not so long that resin_n is never really sampled at a logic low level when V_{CC} reaches minimum operating conditions.

Note: Failure to assert resin_n while the device is powering up will result in unpredictable operation.

Figure 19, Warm Reset Timing, shows the timing sequence when resin_n is applied after V_{cc} is stable and the device has been operating. Any bus operation that is in progress at the time resin_n is asserted will terminate immediately.

While resin_n is active, bus signals lock_n, a19/once_n, and a18–a16 are configured as inputs and weakly held high by internal pull-up transistors. Only a19/ once_n can be overdriven to a low-to-enable ONCE Mode.

7. Bus Timing

Figures 18 through 26 on the following pages present the various bus cycles that are generated by the processor. The figures show the relationship of the various bus signals to clkout. Together with the information present in AC Characteristics, the figures allow the user to determine all the critical timing analysis needed for a given application.

9. Errata

The following errata are associated with Version 0 of the IA186EB/IA188EB. A workaround to the identified problem has been provided where possible.

9.1 Summary

Table 25 presents a summary of errata.

Table 25. Summary of Errata

Errata No.	Problem	Ver. 0	Ver. 2
1	Alternate Mode (TxCON[1] == 1) for timer 0 and 1 has some functional issues.	Exists	Fixed
2	When the extension byte (mod field) is set to “11,” some instructions will cause the CPU to hang.	Exists	Fixed
3	When the chip is put in SFNM mode for INT0 or INT1, the LVL bit is automatically set for those interrupts.	Exists	Fixed
4	Timer 2 will stop or not start counting.	Exists	Fixed
5	Write does not occur when counter is actively counting.	Exists	Fixed
6	Program Counter can become corrupted if an interrupt occurs.	Exists	Fixed
7	Bound instruction uses bad data when index addresses are on odd boundary in memory.	Exists	Fixed
8	Pin LOCK_n does not have an internal pullup and will float during reset and bus hold.	Exists	Exists
9	The Relocation Register (RELREG, PCB offset 0xA8) can only be modified by an 8-bit write.	Exists	Exists
10	When the timer compare register for any of the timers is set to x0000, the max count is xFFFF instead of x10000 as in the OEM part.	Exists	Exists

9.2 Detail

Errata No. 1

Problem: Alternate Mode (TxCON[1] == 1) for timer 0 and 1 has some functional issues.

Description:

- TxOUT will continuously toggle at 1/2 CLKOUT regardless of count register values.
- The maxcount compare will not work. The live count will compare against TxCMPA and TxCMPB in alternate cycles. This could cause a compare (and the associated interrupt, or switch the intended compare, or stop counting altogether) to occur early or not at all.
- The TxOUT pin may start in the wrong state if the user writes to TxCON register Bit [12].
- When in retrigger mode, Timer 1 will not function correctly. Input pulses on T0IN will cause counter to begin counting.

Workaround: None.

Errata No. 2

Problem: When the extension byte (mod field) is set to "11," some instructions will cause the CPU to hang.

Description: Although there are faster versions of each instruction (these are not commonly used by compilers), the following instructions will cause the CPU to hang when the extension byte (mod field) is set to "11":

- 8D (LEA)
- 8F (POP memory)
- C6 (MOV immediate8 to memory/register)
- C7 (MOV immediate16 to memory/register)
- FE (PUSH memory)
- FF (PUSH memory)

Workaround: Substitute instructions in the following table.

Instruction	Workaround
8D (LEA)	Use MOV register (89 or 8B)
8F (POP memory)	Use POP register (0101_0xxx)
C6 (MOV immediate8 to memory/register)	Use MOV immediate8 to register (1011_0xxx)
C7 (MOV immediate16 to memory/register)	Use MOV immediate16 to register (1011_1xxx)
FE (PUSH memory)	Use PUSH register (0101_0xxx)
FF (PUSH memory)	Use PUSH register (0101_0xxx)

Errata No. 3

Problem: When the chip is put in SFNM mode for INT0 or INT1, the LVL bit is automatically set for those interrupts.

Workaround: None.

Errata No. 4

Problem: Timer 2 will stop or not start counting.

Description: Writing a logic "1" to unused bits in the timer control register can cause the timer to stop counting or to never start counting.

Workaround: Do not write a logic "1" to any unused or reserved bits in the timer control register.

Errata No. 5

Problem: Write does not occur when counter is actively counting.

Description: If a timer incremented its count register to the currently active compare register during a write to that count register, the write would not occur.

Workaround: Do not write count register while that counter is actively counting.

Errata No. 6

Problem: Program Counter can become corrupted if an interrupt occurs.

Description: If an interrupt occurs during the decode stage of a TEST instruction using an opcode of the form 1111_0111_1100_0xxx, the Program Counter could become corrupted upon returning from the interrupt handler.

Workaround: None.

Errata No. 7

Problem: Bound instruction uses bad data when index addresses are on odd boundary in memory.

Description: BOUND instruction will use bad data if index address LSB is a "1" in memory.

Workaround: None.

Errata No. 8

Problem: Pin LOCK_n does not have an internal pullup.

Description: Because Pin LOCK_n does not have an internal pullup, it will float during reset and bus hold.

Workaround: An external pullup may be necessary if there is high external load on the signal.

Errata No. 9

Problem:
The Relocation Register (RELREG, PCB offset 0xA8) can only be modified by an 8-bit write.

Description: The Relocation Register (RELREG, PCB offset 0xA8) can only be modified by an 8-bit write. A 16-bit write will have no effect. The 186 EB is unaffected.

Workaround: Use an 8-bit access to affect the RELREG register.

Errata No. 10

Problem:
When the timer compare register for any of the timers is set to x0000, the max count is xFFFF instead of x10000 as in the OEM part.

Description: The timer output will change one count earlier than it should when the max count is set to x0000.

Workaround: The workaround is application dependent. Please contact Innovasic Technical Support if this erratum is an issue.

10. Revision History

Table 26 presents the sequence of revisions to document IA211080214.

Table 26. Revision History

Date	Revision	Description	Page(s)
July 30, 2008	00	First edition released.	NA
October 13, 2008	01	Pin number range “ad15–a8” corrected to “a15–a8” in Figures 26 and 27. Errata No. 4 added. [Also cover page, header, footer, and errata chapter reformatted to meet publication standards.]	66, 67, 78, 79, 80, 81
January 14, 2009	02	Updated errata table for Version 00 – added 3 errata (#5 – 7).	81, 83
March 29, 2009	03	Updated instruction set timing for 186EB; Changed 188EB column to TBD pending completion of new tests; Updated Table 9 ratings; Updated Table 11 parameters and ratings; Removed Figures 16 and 17, and reordered subsequent figures; Updates Table 18 ratings and notes; Updated Table 19 parameters, ratings and notes.	42, 43, 55, 56, 68-72
April 24, 2009	04	Added availability of a non-RoHS compliant version of the 188EB in the 80-pin LQFP package. Added two errata for Version 2 of the device. Noted that all other errata have been fixed in Version 2.	75, 76, 79
May 5, 2009	05	Noted the test conditions used to derive the values in Tables 13 -16; Noted that the Instruction Set Timing in Table 21 applies to all versions of the parts.	51, 68
May 18, 2009	06	Updated Figures 4, 5 and 10. Updated Tables 3, 4, 6, 7, 8, 12. Updated Table 21 to provide revised instruction set timing for the 186EB and to add instruction set timing for the 188EB, based on the most recent test results.	15-18, 23, 25-41, 45, 48, 50, 68-72
June 4, 2009	07	Updated V_{OH} parameter on Table 11; corrected labels on Figures 20-21; Added Errata 10.	43, 61, 62, 80

Date	Revision	Description	Page(s)
September 4, 2009	08	Added a note to Table 12 regarding the Step ID register.	50

11. For Additional Information

The Innovasic Semiconductor IA186EB and IA188EB microcontrollers are form, fit, and function replacements for the original Intel® 80C186EB, 80C188EB, 80L186EB, and 80L188EB 16-bit high-integration embedded processors.

The Innovasic Support Team wants our information to be complete, accurate, useful, and easy to understand. Please feel free to contact our experts at Innovasic at any time with suggestions, comments, or questions.
