

A 0.65V/1 μ A Nanopower Voltage Detector with Dual Outputs

FEATURES

- ◆ Nanopower Voltage Detector in Single 4 mm² Package
- ◆ Ultra Low Total Supply Current: 1 μ A (max)
- ◆ Supply Voltage Operation: 0.65V to 2.5V
- ◆ Preset 0.78V UVLO Trip Threshold
- ◆ Internal \pm 10mV Hysteresis
- ◆ Resettable Latched Comparator
- ◆ Complimentary and Open-drain Comparator Outputs
- ◆ Separate Comparator Output Supply Pin

DESCRIPTION

The TS12001 voltage detector combines a 0.58V reference and a comparator with resettable comparator latch in a single package. The TS12001 operates from a single 0.65V to 2.5V power supply and consumes less than 1 μ A total supply current. Optimized for ultra-long life operation, the TS12001 expands Touchstone's growing "NanoWatt Analog™" high-performance analog integrated circuits portfolio.

The voltage detector exhibits a preset UVLO threshold voltage of 0.78V (typ) or can be set to other threshold voltages with two external resistors. The comparator exhibits \pm 10mV of internal hysteresis for clean, chatter-free output switching. The TS12001 also offers both push-pull and open-drain outputs. When compared against similar products, the TS12001 offers a factor-of-2 lower power consumption and at least a 33% reduction in pcb area.

The TS12001 is fully specified over the -40°C to +85°C temperature range and is available in a low-profile, 10-pin 2x2mm TDFN package with an exposed back-side paddle.

APPLICATIONS

Power-Fail Indicator
 Low-Battery Detection
 Battery-Backup Detection
 CPU, Microprocessor, and Logic Reset Controller
 Battery-powered Systems

TYPICAL APPLICATION CIRCUIT

A Nanopower 1.8V Core System Voltage Detector

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V_{IN} to V_{SS})+2.75V	Output Current	
Supply Voltage (OV_{DD} to V_{SS})+2.75V	COUTPP, COUTOD20mA
Input Voltage		Short-Circuit Duration	
SET $V_{SS} - 0.3V$ to $V_{IN} + 0.3V$	(REFOUT, COUTPP, COUTOD)Continuous
LHDET $V_{SS} - 0.3V$ to +5.5V	Continuous Power Dissipation ($T_A = +70^\circ C$)	
Output Voltage		10-Pin TDFN (Derate at 13.48mW/ $^\circ C$ above +70 $^\circ C$) 1078mW
REFOUT $V_{SS} - 0.3V$ to $V_{IN} + 0.3V$	Operating Temperature Range -40 $^\circ C$ to +85 $^\circ C$
COUTPP $V_{SS} - 0.3V$ to $OV_{DD} + 0.3V$	Junction Temperature+150 $^\circ C$
COUTOD $V_{SS} - 0.3V$ to +5.5V	Storage Temperature Range -65 $^\circ C$ to +150 $^\circ C$
		Lead Temperature (Soldering, 10s) +300 $^\circ C$

Electrical and thermal stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to any absolute maximum rating conditions for extended periods may affect device reliability and lifetime.

PACKAGE/ORDERING INFORMATION

Lead-free Program: Touchstone Semiconductor supplies only lead-free packaging.

Consult Touchstone Semiconductor for products specified with wider operating temperature ranges.

ELECTRICAL CHARACTERISTICS

$V_{IN} = 0V_{DD} = 0.8V$; $V_{SS} = 0V$; $V_{SET} = V_{SS}$; $V_{COUTPP} = HiZ$; $V_{COUTOD} = HiZ$; $T_A = -40^{\circ}C$ to $+85^{\circ}C$, unless otherwise noted. Typical values are at $T_A = +25^{\circ}C$. See note 1.

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS		
Supply Voltage	V_{IN}		0.65		2.5	V		
Supply Current	I_{IN}	REFOUT = open	$T_A = +25^{\circ}C$ $-40^{\circ}C \leq T_A \leq 85^{\circ}C$		0.8 1	μA		
UVLO Output Driver Supply Voltage	$0V_{DD}$		0.65		2.5	V		
Output Driver Supply Current	I_{ODD}				0.1	μA		
Preset UVLO Trip Point		V_{IN} falling until COUTPP switches LOW	725	761	797	mV		
		V_{IN} rising until COUTPP switches HIGH	743	781	818

Reference Load Regulation		$I_{OUT} = \pm 100nA$			0.5	%		
Output High Voltage	V_{OH}	COUTPP; $I_{OUT} = -100\mu A$	$V_{IN} - 0.1$			V		
Output Low Voltage	V_{OL}	COUTPP; $I_{OUT} = 100\mu A$			$V_{SS} + 0.1$	V		
Output Low Voltage	V_{OL}	COUTOD; $I_{OUT} = 100\mu A$			$V_{SS} + 0.11$	V		
Output Short-Circuit Current,	I_{SC}	Sourcing; $V_{COUTPP} = V_{SS}$	0.1			mA		
		Sinking; $V_{COUTPP} = V_{IN}$	0.5			mA		
		Sinking; $V_{COUTOD} = V_{IN}$		1.4			mA	
Open Drain Leakage		COUTOD; $V_{COUTOD} = 5V$			20	nA		

Note 1: All devices are 100% production tested at $T_A = +25^{\circ}C$ and are guaranteed by characterization for $T_A = T_{MIN}$ to T_{MAX} , as specified.

Note 2: A SET voltage above this threshold voltage enables the SET pin voltage to control the comparator output.

TYPICAL PERFORMANCE CHARACTERISTICS

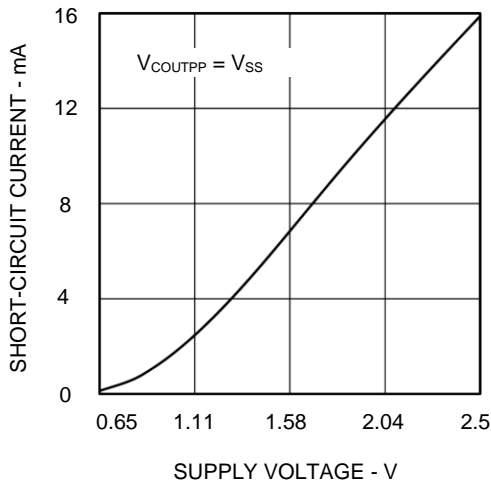

$V_{IN} = OV_{DD} = 2.5V$; $V_{SS} = 0V$; $V_{SET} = V_{SS}$; $V_{COUTPP} = HiZ$; $V_{COUTOD} = HiZ$, unless otherwise noted. Typical values are at $T_A = +25^\circ C$.

TYPICAL PERFORMANCE CHARACTERISTICS

$V_{IN} = OV_{DD} = 2.5V$; $V_{SS} = 0V$; $V_{SET} = V_{SS}$; $V_{COUTPP} = HiZ$; $V_{COUTOD} = HiZ$, unless otherwise noted. Typical values are at $T_A = +25^\circ C$.

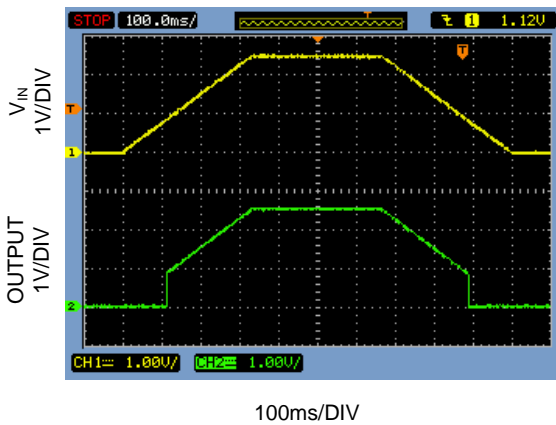

COUTPP Short-Circuit Current vs Supply Voltage
 $V_{COUTPP} = V_{SS}$

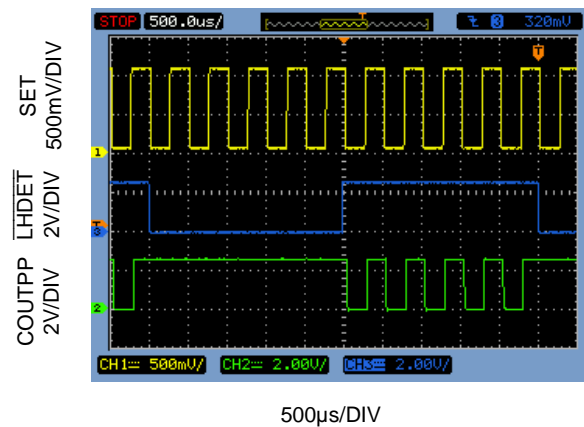

COUTPP Short-Circuit Current vs Supply Voltage
 $V_{COUTPP} = V_{IN}$

COUTPP Power-Up Transient Response
 $V_{SET} = 2.5V$, $C_{LOAD} = 15pF$

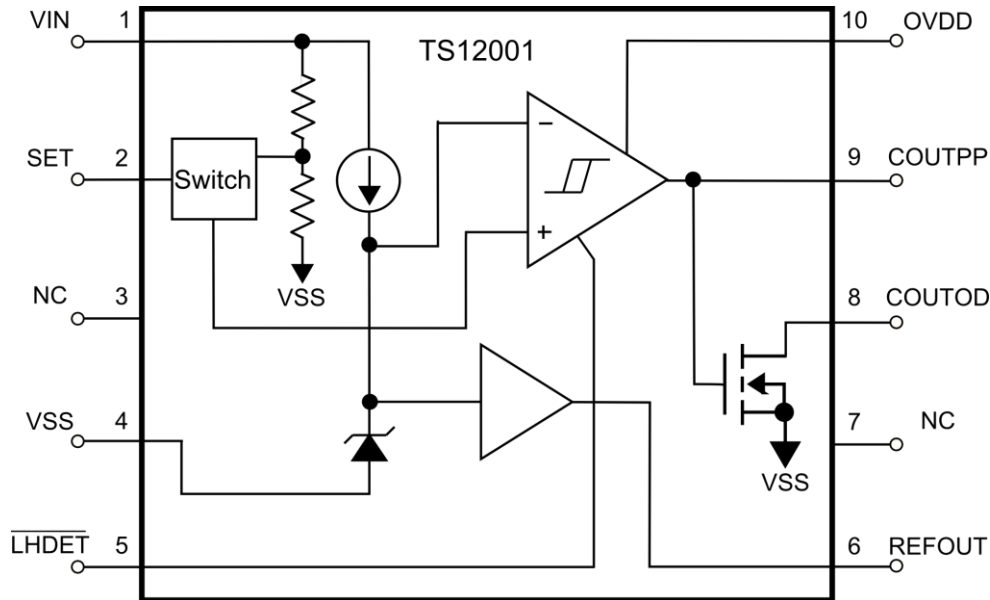

COUTPP Transient Response with LHDET
 $V_{IN} = OV_{DD} = 2.5V$, $C_{LOAD} = 15pF$

PIN FUNCTIONS

PIN	NAME	FUNCTION
1	VIN	Positive Supply Voltage. Connect a 0.1 μ F bypass capacitor from this pin to analog VSS/GND.
2	SET	External UVLO Trip Threshold Set Pin. When this pin is set to VSS, the internal preset 0.78V UVLO trip threshold controls the comparator output. When the applied voltage to this pin is higher than 90mV, the SET pin sets the trip threshold and controls the comparator output. If the SET pin is not used, connect the pin to to VSS.
3	NC	No Connection
4	VSS	Negative Supply Voltage.
5	$\overline{\text{LHDET}}$	Latch Enable Pin. When $\overline{\text{LHDET}}$ is set HIGH, the outputs of the comparator will toggle normally based on the inputs to the comparator. When $\overline{\text{LHDET}}$ is set LOW and COUTPP is HIGH, COUTPP will remain HIGH despite any changes to the input of the comparator. COUTPP will once again respond to changes to the input when $\overline{\text{LHDET}}$ is toggled HIGH. If COUTPP is initially LOW and the $\overline{\text{LHDET}}$ is then LOW, COUTPP will stay LOW. If a LOW-to-HIGH transition occurs on COUTPP, COUTPP will switch to HIGH and stay HIGH and not respond to any changes at the input. The $\overline{\text{LHDET}}$ pin must always be set to a known state. For unlatched comparator operation, set $\overline{\text{LHDET}}$ to HIGH. The open-drain output (COUTOD) is the inverted version of the COUTPP output.
6	REFOUT	0.58V Reference Output
7	NC	No Connection
8	COUTOD	Comparator Open-Drain Output
9	COUTPP	Comparator Push-Pull Output
10	OVDD	Output Driver Positive Supply Voltage. Connect a 0.1 μ F bypass capacitor from this pin to analog VSS/GND.
EP	----	Exposed paddle is electrically connected to VSS/GND.

BLOCK DIAGRAM

THEORY OF OPERATION

The TS12001 combines a $0.58\text{V} \pm 4.5\%$ reference and an analog comparator with a resettable comparator latch in a single package. The TS12001 operates from a single 0.65V to 2.5V power supply and consumes less than $1\mu\text{A}$ total supply current. The TS12001 comparator has a push-pull and open-drain output driver. The push-pull output driver is powered from a separate supply voltage, OV_{DD} . The open-drain output stage allows for easy output voltage level translation as may be required when driving systems powered with a different power supply rail. The analog comparator exhibits $\pm 10\text{mV}$ of internal hysteresis for clean, chatter-free output switching. The internal reference was designed to sink or source up to $0.1\mu\text{A}$ load currents.

The TS12001 has a preset UVLO threshold voltage of 0.78V (typ) or can be set to other threshold voltages with two external resistors where the divided

voltage is applied to the SET pin. When the SET pin voltage is grounded or it is less than approximately 90mV , the internal preset UVLO threshold circuit will control the comparator outputs. If the SET pin is above approximately 90mV , the external voltage divider circuit will control the comparator outputs. The 0.58V reference voltage is tied to the inverting input of the comparator and the output of a switch is connected to the non-inverting input of the comparator. The output of the switch is either the SET voltage or the internal UVLO threshold voltage, depending on whether the SET pin voltage is above or below approximately 90mV . If the switch output is above 0.58V , the push-pull output (COUTPP) will be HIGH and the open-drain output (COUTOD) will be LOW and vice versa. For proper operation, the supply voltage V_{IN} must be applied before the output driver supply voltage (OV_{DD}) is applied.

The TS12001 has a latch enable pin ($\overline{\text{LHDET}}$) that

allows the output of the comparator to latch to a HIGH state under certain conditions. If $\overline{\text{LHDET}}$ is set HIGH, the COUTPP output will switch based on the input to the comparator. When $\overline{\text{LHDET}}$ is set LOW and COUTPP is HIGH, COUTPP will remain HIGH until $\overline{\text{LHDET}}$ goes LOW. When COUTPP is initially LOW instead, COUTPP will latch HIGH until a LOW-to-HIGH transition occurs on the COUTPP output. In essence, the $\overline{\text{LHDET}}$ pin offers a LOW-to-HIGH detection. However, $\overline{\text{LHDET}}$ must not be left open. The open-drain output, COUTOD, is the inverter version of the COUTPP output. Connect $\overline{\text{LHDET}}$ to V_{IN} for normal operation or to V_{SS} for $\overline{\text{LHDET}}$ enable.

If the SET pin is not used, it cannot be left unconnected and should be tied to V_{SS} .

Comparator

The TS12001 has an internal comparator that can eliminate supply glitches that commonly occur when output transitions occur. In addition, the input exhibits $\pm 10\text{mV}$ of internal hysteresis in order to insure clean output switching behavior. The outputs can swing to

within 100mV of the supply rails. The COUTPP output can source and sink 0.1mA and 0.5mA of current. The COUTD outputs can sink 1.4mA of current with $V_{\text{COUTOD}} = 0.78\text{V}$

Internal Reference

The TS12001's on-board 0.58V $\pm 4.5\%$ reference voltage can source and sink 0.1 μA and 0.1 μA of current and can drive a capacitive load less than 50pF and greater than 50nF with a maximum capacitive load of 250nF. The higher the capacitive load, the lower the noise on the reference voltage and the longer the time needed for the reference voltage to respond and become available on the REFOUT pin. With a 250nF capacitive load, the response time is approximately 20ms. While also available as a separate pin as REFOUT, the reference is tied internally to the inverting input of the comparator.

APPLICATIONS INFORMATION

External Voltage Detector Design

Depending on the battery voltage used and the voltage one wishes to detect, the TS12001 can be designed accordingly. As shown in Figure 1, R1 and R2 can be selected based on the desired voltage to detect. Table 1. provides R1 and R2 resistor combinations for detecting various V_{IN} voltages.

V_{IN} Threshold Voltage(V)	R1(M Ω)	R2(M Ω)
0.9	2.2	4.02
1.07	3.32	4.02
1.28	4.75	4.02
1.52	6.49	4.02
1.85	8.66	4.02

Table 1. Resistor Combinations for Several V_{IN} Threshold Voltages

The design equation for this circuit is shown below. The SET pin voltage (V_{SET}) that will cause a HIGH-to-LOW transition on the output is approximately 580mV. To design the circuit, R1 or R2 can be selected along with the desired battery voltage to detect.

Then, the second resistor value can be evaluated using the voltage divider equation below.

$$R1 = \frac{V_{\text{IN}} \times R2 - V_{\text{SET}} \times R2}{V_{\text{SET}}}$$

A Nanopower 1.8V Core System Voltage Detector

When power supply rails sag in any system, it is important to alert the CPU. A CPU can be used to detect when I/O or core system voltages sag below a prescribed threshold as shown Figure 2. In this circuit, a 1.8V core system voltage detector is designed around the TS12001 providing a low battery detect signal. R1 and R2 were selected to set a SET voltage at 582mV so that when V_{CORE} drops below 1.77V, the TS12001 output transitions to LOW. It is recommended to use 1% resistors for optimal accuracy. The circuit consumes approximately 0.75 μA of current when $V_{\text{CORE}} = 1.8\text{V}$.

PC Board Layout and Power-Supply Bypassing

While power-supply bypass capacitors are not typically required, it is good engineering practice to use 0.1 μF bypass capacitors close to the device's power supply pins. When the power supply impedance is high, the power supply leads are long, or there is excessive noise on the power supply traces. To reduce stray capacitance, it is also good

engineering practice to make signal trace lengths as short as possible. Also recommended are a ground plane and surface mount resistors and capacitors.

Input Noise

Radiated noise is common in low power circuits that require high impedance circuits. To minimize this effect, all traces between any of the inputs and passive component networks should be made as short as possible.
