## Datasheet

### Unigen Corporation

### CompactFlash<sup>®</sup> Card

#### FEATURES

- CompactFlash, PCMCIA and ATA specification standard
- Compliance:
  - PCMCIA version 2.1
  - PC Card ATA version 2.01
- Interface: CompactFlash, PC Card ATA and true ATA/IDE
- Compatible with all PC Card Services and Socket Services.
- Compatible with host ATA disk I/O BIOS, DOS/Windows/Linux file system.
- High Performance Throughput:
  - Typical Read: 9.0 MB/s
  - Typical Write: 4.0 MB/s
  - (Hdbench, USB 2.0 card reader, 2.0 GHz PC, 15MB file; speed subject to change based on system setup)
- Available Storage Capacities:
  - Type I: 32MB, 64MB, 128MB, 256MB, 512MB, 1GB, 2GB, 4GB
- Support for 3.3 Volt and 5Volt Power Supply
- Access modes:
  - PC Card Memory Mode
  - PC Card I/O Mode
  - True-IDE Mode (supports up to PIO Mode 4, Multiword DMA mode 2)
- Hardware Data Protection
- Firmware Upgradeable
- Auto Sleep Mode
- Power Consumption (3.3V/ 5.0V).
  - Active mode (typical): 30 mA/ 35 mA
  - Sleep mode (typical): 300 uA / 350 uA
- High reliability and long life
  - Internal ECC (Error Correcting Code) results in high data reliability
  - World Class wear leveling ensures all Flash is used evenly, resulting in extremely long card life
- Temperature Range: 0 to 70 °C
- Lead-Free Product

#### PRODUCT DESCRIPTION

# CompactFlash<sup>®</sup> - UGB30SHS

---

Solutions for a Real Time World

Unigen's UGB30SHSXXXX CompactFlash cards are storage devices that use solid-state flash technology as the storage media. This ultrahigh speed, rugged, storage media are ideal for consumer products and variety of embedded and industrial applications. Up to 16GByte cards can be built using a Type I CompactFlash form-factor. With a PC Card adapter, UGB30SHSXXXX CompactFlash cards can be used in any Type II or Type III PCMCIA slot.

ALL UGB30SHSXXXX are configured as CFA cards (based on SLC NAND Flash memory) unless otherwise specified by the customer.

## 1 GENERAL DESCRIPTION

The Unigen Corporation CompactFlash card contains a Hyperstone Media designed Flash controller, programmable firmware and flash memory module(s). The proprietary space manager architecture in the controller maximizes read/write data rate performance to and from the host and flash memory, eliminating firmware delays during sector read and write operations. The Hyperstone Media Flash controller, combined with tailored firmware, provides complete ATA disk emulation, which ensures complete compatibility with a wide range of operating systems.

## 2 BLOCK DIAGRAM

## 2.0 COMPACTFLASH CARD SETUP PARAMETERS

Model Number	Form Factor	Capacity in Bytes	Sectors/ Card	Cylinders	Heads	Sectors/ Track
UGB30SHS0032	Type I	31,981,568	62,464	488	4	32
UGB30SHS0064		64,094,208	125,184	978	4	32
UGB30SHS0128		128,188,416	250,368	978	8	32
UGB30SHS0256		261,619,712	510,976	998	16	32
UGB30SHS0512		526,934,016	1,029,168	1021	16	63
UGB30SHS1000		1,050,771,456	2,052,288	2036	16	63
UGB30SHS2000		2,102,575,104	4,106,592	4074	16	63
UGB30SHS4000		4,206,182,400	8,215,200	8150	16	63
UGB30SHS8000		8,414,945,280	16,435,440	16305	16	63
UGB30SHS16H0		16,494,428,160	32,215,680	31960	16	63

**NOTE:** To calculate the "Capacity in Bytes", use the following formula:

- Capacity in Bytes = Cylinders \* Heads \* Sectors \* 512 bytes per sector.  
Unigen defines 1MBytes = 10<sup>6</sup> bytes. The capacities of all Unigen CompactFlash cards are in decimal values. Available user capacity may varies

*Parameters in the above table are subject to change without advanced notice.*

## 2.1 ELECTRICAL INTERFACE

This section provides information on the Electrical Interface Descriptions, the Bus Timing, PC Card ATA Interface compliant Register set, ATA Task File Register set, and the Host Commands for both CompactFlash cards.

### 2.1.1 CompactFlash Electrical Interface

UGB30SHSXXXX CompactFlash card is fully compliant with the CompactFlash specifications. This interface standard electrically complies with the PC Card ATA specifications, functioning in the I/O mode, the Memory mode, True IDE mode.

### 2.1.2 Interface Connector

The Host is connected to the CompactFlash card using a standard 50-pin connector, consisting of two rows of 25 female contacts on 1.27 mm (50 mils) centers. In addition, the CompactFlash card can be used with a PCMCIA Type II passive adaptor, which converts the CompactFlash card to a Type II PCMCIA PC card.

### 2.1.3 Connector Pin Assignments

Table 3-1 below lists the signal/pin assignments for the CompactFlash card. Active low signals have a "-" prefix.

The superscript<sup>1</sup> after Pin Numbers indicate that the functionality of that pin changes between I/O mode, Memory mode and/or True IDE mode operation.

The following abbreviations are used for signal types: (I) indicates input to CompactFlash; (O) indicates output from CompactFlash; (I/O) indicates a bi-directional signal; (TS) indicates three-state; (OC) indicates open collector.

**Table 2-1: 50-pin CompactFlash Connector Pin Assignments and Type**

Pin No.	Signal	Signal Types	Function
1	GND	DC	Ground
2	HDB3	I/O	Data bit 3
3	HDB4	I/O	Data bit 4
4	HDB5	I/O	Data bit 5
5	HDB6	I/O	Data bit 6
6	HDB7	I/O	Data bit 7
7 <sup>1</sup>	-CE1/-CS0	I	Card Enable 1/Chip Select 0
8	HA10	I	Address bit 10
9 <sup>1</sup>	-OE/-ATA SEL	I	Output Enable/ATA Select
10	HA9	I	Address bit 9
11	HA8	I	Address bit 8
12	HA7	I	Address bit 7
13	VCC	DC in	Supply Voltage
14	HA6	I	Address bit 6
15	HA5	I	Address bit 5
16	HA4	I	Address bit 4
17	HA3	I	Address bit 3
18	HA2	I	Address bit 2
19	HA1	I	Address bit 1
20	HA0	I	Address bit 0
21	HDB0	I	Data bit 0
22	HDB1	I	Data bit 1
23	HDB2	I	Data bit 2
24 <sup>1</sup>	WP/-IOIS16/-IOCS16	O	Write Protect/I/O port is 16-bit
25	-CD2	O	Card Detect 2
26	-CD1	O	Card Detect 1
27	HDB11	I/O	Data bit 11
28	HDB12	I/O	Data bit 12
29	HDB13	I/O	Data bit 13
30	HDB14	I/O	Data bit 14
31	HDB15	I/O	Data bit 15
32 <sup>1</sup>	-CE2/-CS1	I	Card Enable 2/Chip Select 1
33	-VS1	O	Voltage Sense 1
34 <sup>1</sup>	-IOR	I	I/O Read
35 <sup>1</sup>	-IOW	I	I/O Write
36	-WE	I	Write Enable
37 <sup>1</sup>	RDY/-IREQ/HINT	O	Ready/Interrupt Request/Host Interrupt
38	Vcc	DC in	Supply Voltage
39 <sup>1</sup>	-CSEL	I	Card Select (in True IDE mode)
40	-VS2	O	Voltage Sense 2
41 <sup>1</sup>	RESET/-RESET	I	Host Reset

**Table 2-1: 50-pin CompactFlash Connector Pin Assignments and Type**

Pin No.	Signal	Signal Types	Function
42 <sup>1</sup>	-WAIT/IORDY	O	Extend Bus Cycle/ I/O Ready
43 <sup>1</sup>	-INPACK/DREQ	O	Input Acknowledge/DMA Request
44 <sup>1</sup>	-REG	I	Register (Attribute Memory) Select
45 <sup>1</sup>	BVD2/-SPKR /-DASP	I/O	Battery Voltage Detect2/Speaker/Device Active or Slave Present
46 <sup>1</sup>	BVD1/-STSCHG/-PDIAG	I	Battery Voltage Detect1/ Card Status Change/Passed Diagnostics
47	HDB8	I	Data bit 8
48	HDB9	I	Data bit 9
49	HDB10	I	Data bit 10
50	GND	DC	Ground

## 2.1.4 CompactFlash Signal Definitions

Table below defines the CompactFlash signals that interface with the Host.

**Table 2-2: 50-Pin CompactFlash Connector Signal Definitions**

Name	Pin No.	Type	Description
BVD1/ STSCHG PDIAG	46 <sup>1</sup>	I/O	<b>BATTERY VOLTAGE DETECT 1:</b> In Memory mode, this output signal is always asserted (high), since a battery is not required with the CompactFlash. <b>STATUS CHANGED:</b> In I/O mode, this signal is used to indicate a change in RDY/BSY or Write Protect states. <b>PASSED DIAGNOSTICS:</b> In True IDE mode this signal is used between two drives to indicate that the drive in Slave mode has passed diagnostics.
BVD2/ - SPKR/ - DASP	45 <sup>1</sup>	I/O	<b>BATTERY VOLTAGE DETECT 2:</b> In Memory mode, this output signal is always asserted (high), since a battery is not used with the CompactFlash. <b>SPEAKER:</b> In I/O mode, this output signal is always de-asserted (low), since the CompactFlash does not support audio functions. <b>DEVICE ACTIVE/SLAVE PRESENT:</b> In True IDE mode, this is the Device Active/Slave Present signal.
-CD1 -CD2	26 25	O O	<b>CARD DETECT:</b> These outputs are directly connected to ground on the Compact Flash. By sensing these signals, the Host determines that the card is fully inserted into the socket.
-CE1/CS0 - CE2/CS1	7 <sup>1</sup> 32 <sup>1</sup>	I I	<b>CARD ENABLE:</b> These inputs select the card and indicate to the CompactFlash whether a byte or word operation is being performed. -CE2 always accesses the odd byte of the word; CE1 accesses the even or odd byte of the word depending on the status of A0 and -CE2. <b>CHIP SELECT:</b> In True IDE mode, CS0 selects the ATA Command Block Registers, while CS1 selects the ATA Control Block Registers.
-CSEL	39 <sup>1</sup>	I	<b>CARD SELECT:</b> This signal is not used in the Memory or I/O modes. In True IDE mode, this signal configures the drive as a Master or Slave. If the signal is de-asserted (low), the drive is configured as a Master. If the pin is open, the drive is configured as a slave.

**Table 2-2: 50-Pin CompactFlash Connector Signal Definitions**

Name	Pin No.	Type	Description
HA10 HA9 HA8 HA7 HA6 HA5 HA4 HA3 HA2 HA1 HA0	8 10 11 12 14 15 16 17 18 19 20	I I I I I I I I I I I	<b>ADDRESS[10:0]:</b> In I/O and Memory mode, these are the Host Address lines that select the I/O port address registers or the memory mapped port address registers, and the control and status registers.  In True IDE mode, only HA[2:0] are used to select the control, status and data register; HA[10:3] are not used in this mode.
HDB15 HDB14 HDB13 HDB12 HDB11 HDB10 HDB9 HDB8 HDB7 HDB6 HDB5 HDB4 HDB3 HDB2 HDB1 HDB0	31 30 29 28 27 49 48 47 6 5 4 3 2 23 22 21	I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O	<b>DATA [15:0]:</b> These bi-directional signals carry the data, commands, and status information between the Host and the controller.
-INPACK/ DREQ	43 <sup>1</sup>	O	<b>INPUT PORT ACKNOWLEDGE:</b> In I/O mode, this input signal is asserted when the card is selected and can respond to an I/O cycle at the address on the address bus. This signal is used by the Host to control the enable of any input data buffer between the card and Host system data bus.  This signal is not used in Memory mode.  <b>DMA REQUEST:</b> In True IDE mode, this signal is used as the DMA Request signal. This signal is not used in the Memory mode.
-IOR	34 <sup>1</sup>	I	<b>I/O READ:</b> In I/O mode, and True IDE mode, this input pulse clocks I/O data from the internal controller to the card bus. This signal is not used in Memory mode.
-IOW	35 <sup>1</sup>	I	<b>I/O WRITE:</b> In I/O mode, and True IDE mode, this input pulse clocks I/O data from the card bus to the internal controller. This signal is not used in Memory mode.
-OE/ -ATA SEL	9 <sup>1</sup>	I	<b>OUTPUT ENABLE:</b> In I/O and Memory modes his input signal is used to gate Memory Read data from the memory card. In Memory mode it is used to read both data and the CIS and Configuration registers. In I/O mode, this signal is used to read the CIS and Configuration registers only.  <b>ATA SELECT:</b> This signal should be grounded to enable True IDE mode.
RDY/BSY IREQ/HINT	37 <sup>1</sup>	O	<b>READY/BUSY:</b> In Memory mode, this input is set high to indicate that the CompactFlash is ready to accept a new data transfer operation. This signal is held low when the card is busy. A pull-up resistor must be provided on the Host memory card socket.  During Power Up and at Reset, this signal must be held low, and no access should be made to the CompactFlash until the Power Up or Reset sequence is complete. The only exception is if the CompactFlash is being Powered Up with the RESET signal disconnected or asserted; in this case the RDY/BSY signal is held high (RDY signal).  <b>INTERRUPT REQUEST:</b> In I/O mode, this input is strobed low to generate a pulse-mode interrupt or held low for a level-mode interrupt.  <b>HOST INTERRUPT:</b> In True IDE mode this is the Interrupt Request to the Host (active high).

**Table 2-2: 50-Pin CompactFlash Connector Signal Definitions**

Name	Pin No.	Type	Description
-REG	44 <sup>1</sup>	I	<b>REGISTER (ATTRIBUTE) MEMORY SELECT:</b> In Memory mode, this input signal distinguishes the register (attribute) memory from the common memory. In I/O mode, this signal must be asserted (low) when the I/O address is on the bus.  In True IDE mode, this signal is used as the DMA Acknowledge signal.
RESET/ - RESET	58	I	<b>RESET:</b> The CompactFlash is reset when this signal is set, initializing the control and status registers and aborting any command in progress. In PC card mode, this signal is active high; in True IDE mode, it is active low.
-WE	36 <sup>1</sup>	I	<b>WRITE ENABLE:</b> In Memory mode, this input signal is used for strobing Memory Write data into the CompactFlash. In both Memory mode and I/O mode, this signal is used for writing the configuration register, in conjunction with the REG signal.  In True IDE mode, this signal is not used and should be connected to Vcc.
WP/ - IOIS16 /- IOCS16	24 <sup>1</sup>	O	<b>WRITE PROTECT:</b> In Memory mode this signal is used to reflect the status of the cards write protect switch. At this time the CompactFlash is not configured with a write protect switch.  <b>I/O PORT IS 16 BITS:</b> In I/O operation, this output selects the 16-bit port. A low signal indicates that a 16-bit port is being addressed or an odd byte only operation can be performed at the addressed port.  In True IDE mode, this signal is IOCS16. A low signal indicates that a 16-bit transfer is in progress on the Host bus. This open collector line is only driven on assertion (low).
-WAIT/ IOCHRDY	42 <sup>1</sup>	O	<b>WAIT:</b> In Memory mode, and I/O mode, this output is driven by the CompactFlash to signal the Host to insert a delay before completing a memory or I/O cycle.  <b>IOCHRDY:</b> In True IDE mode, this is the active high I/O Channel Ready signal where a low signal indicates that the CompactFlash is NOT ready and the Host should extend the cycle for the present command.
GND	1 50	DC	<b>GROUND:</b> These two pins supply ground for the CompactFlash.
VCC	13 38	DC in	<b>+ 3.3v or + 5 VOLTS:</b> These pins supply 3.3v or 5 V to the CompactFlash.
-VS1	33	O	<b>VOLTAGE SENSE 1:</b> This signal is grounded, so that the CompactFlash CIS can be read at 3.3 volts.
-VS2	40	O	<b>VOLTAGE SENSE 2:</b> This pin is reserved for a secondary voltage.
<sup>1</sup> Functionality of Pin changes between Memory mode, I/O mode, and True IDE mode operation			

## 3 PRODUCT SPECIFICATIONS

### 3.1 ENVIRONMENTAL AND RELIABILITY CHARACTERISTICS

Shock	2,000 G max. (operating/non-operating)
Vibration	15 G peak to peak max. (operating/non-operating)
Acoustic Noise	0 dB
Humidity	5% to 95%, non-condensing
Altitude	80,000 ft max.
MTBF	1,000,000 power-on hours
Data Reliability	1 in 10 <sup>14</sup> bits, read
Endurance	>3,000,000 erase/program cycles (see app note)

### 3.2 DATA TRANSFER RATES

<b>Speed Rate</b>	<b>Sustained Read Speed (Min.)</b>
60X	9.0MB/S
<b>Speed Rate</b>	<b>Sustained Write Speed (Min.)</b>
26X	4.0MB/s

### 3.3 PRODUCT SPEED AVAILABILITY

The UGB30SHSXXXX CompactFlash cards are available in one choices of speed; 50X where X denotes a sustained write performance of 150Kbytes per second.

### 3.4 ELECTRICAL CHARACTERISTICS

#### 3.4.1 Absolute Maximum Ratings

Parameters	Symbol	Min	Max	Unit
Storage Temperature	Tstg	-25	+85	°C
Input Power	Vcc	-0.3	6.5	V
Voltage on any pin except Vcc with respect to GND	V	0.5	Vcc+0.5	V

**NOTE:** Stress above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 3.4.2 Input Power

Voltage	Maximum Average RMS Current	Measurement Method
3.3V ± 5%	75 mA	3.3V at 25°C
5.0V ± 10%	100 mA	5.0V at 25°C

**NOTE:** Current measurement is accomplished by connecting an amp meter (set to the 2 amp scale range) with a fast current probe with an RC filter in series with the Vcc supply to the CompactFlash card. Current measurements are to be taken while looping on a data transfer command with a sector count of 128. Current consumption values for both read and write commands are not to exceed the Maximum Average RMS Current specified in the above table.

## 3.4.3 Recommended Operating Conditions

Parameters	Symbol	Min	Max	Unit	Test Condition
Operating Temperature	Ta	0	70	°C	
Supply Voltage	Vcc	3.15	3.45	V	
Supply Voltage	Vcc	4.5	5.5	V	

## 3.4.4 Input Leakage Current

Parameters	Type	Symbol	Min	Max	Unit	Test Condition
Input Leakage Current	IxZ	IL	-10	10	μA	Vil = GND; Vih = Vcc
Pull Up Resistor	IxU	RPU1	50k	500k	Ohm	Vcc = 5.0V
Pull Down Resistor	IxD	RPD1	50k	500k	Ohm	Vcc = 5.0V

**NOTE:** In the table above, x refers to the characteristics described in section 3.5 below. For example, I1U indicates a pull up resistor with a type 1 input characteristic.

### 3.4.5 DC Characteristics (Ta = 0 to +60°C, Vcc = 5.0V ± 10%, Vcc = 3.3V ± 5%)

Parameters	Symbol	Min	Max	Unit	Test Condition
Input Low Voltage CMOS	Vil	-	Vcc x 0.3V	V	
Input High Voltage CMOS	Vih	Vcc x 0.7V	-	V	
Output Low Voltage CMOS	Vol	GND	GND + 0.4V	V	Iol = 4mA
Output High Voltage CMOS	Voh	Vcc - 0.8	Vcc	V	Ioh = -4mA
Read Current	Irc		65	mA	
Write Current	Iwr		65	mA	
Sleep Current	Isc		300	uA	

## 4 BUS TIMING

This bus timings for Unigen Corporation's UGB30SHSXXXX CompactFlash card supports timing modes 5 & 6 as specified in the CompactFlash Specification 3.0 for timing information, please refer to the CompactFlash Specification.

### 4.1 ATTRIBUTE MEMORY ACCESS

Unigen Corporation CompactFlash card contains 256 bytes of fully static RAM to be used to hold the Card Information Structure (CIS). This starts at Attribute Memory Address 000H and continues through Attribute Memory Address 1FEH. Only even locations are accessible within attribute memory space. The base address of the card configuration registers is 200h. This SRAM can be read or written by both the Host and the local micro controller.

#### 4.1.1 Attribute Memory Read

Table 4-1: Attribute Memory Read Access

Mode	-REG	-CE2	-CE1	A10	A9	A0	-OE	-WE	D15-D8	D7-D0
Standby mode (no access)	X	1	1	X	X	X	X	X	High-Z	High-Z
CIS Byte Access	0	1	0	0	0	0	0	1	High-Z	Even byte
Configuration Byte Access	0	1	0	0	1	0	0	1	High-Z	Even byte
CIS Word Access	0	0	0	0	0	X	0	1	Not Valid	Even Byte
Configuration Word Access	0	0	0	0	1	X	0	1	Not Valid	Even byte

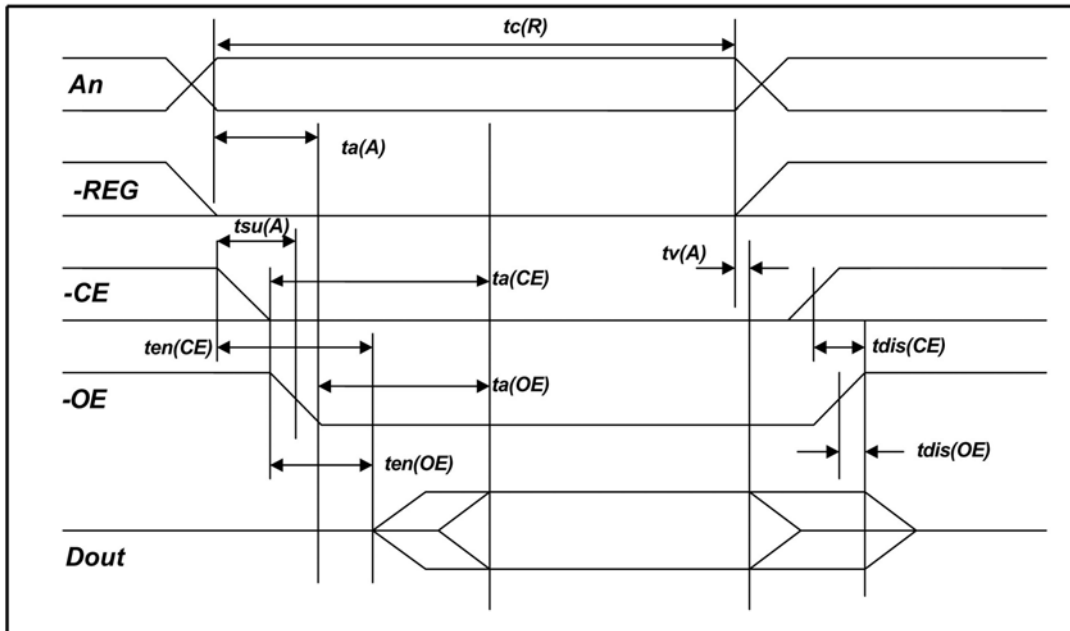

**Table 4-2: Attribute Memory Read Timing**

Parameters	Speed Version		300ns	
	Symbol	IEEE Symbol	Min	Max
Read Cycle Time	$t_c(R)$	$t_{AVAV}$	200	
Address Access Time	$t_a(A)$	$t_{AVQV}$		300
Card Enable Access Time	$t_a(CE)$	$t_{ELQV}$		300

<sup>1</sup> -IOIS16 and -INPACK are not supported in this mode.

<sup>2</sup> WAIT is not supported in this mode

<sup>3</sup> The maximum load on -WAIT, -INPACK and -IOIS16 is 1 LSTTL with 50pF (40pF below 120ns Cycle Time) total load. All times are in nanoseconds. Minimum time from -WAIT high to -IORD high is 0ns, but minimum -IORD width shall be met. Din signifies data provided by the UGB30SHSXXX Card to the system.

**NOTE:** Unigen Corporation's CompactFlash card could run at PIO mode 4 as of ATA-4 specifications timing stated. To take advantage of Unigen Corporation technology in term of performance, we encourage the host designer to configure their system to run at PIO mode 4 timing. Please refer to section 7.3 of ATA-4 specification for additional information on how to achieve the PIO mode 4 timing.

-IOR/-IOW to address valid hold	T9	20	15	10	10	10	10	10	
Read Data Valid to IORDY active (min) (if IORDY initially low after tA)	tRD	0	0	0	0	0	0	0	
IORDY Setup time	tA	35	35	35	35	35	N/A <sup>5</sup>	N/A <sup>5</sup>	3
IORDY Pulse Width (max)	tB	1250	1250	1250	1250	1250	N/A <sup>5</sup>	N/A <sup>5</sup>	
IORDY assertion to release (max)	tC	5	5	5	5	5	N/A <sup>5</sup>	N/A <sup>5</sup>	

**Notes:**

All timings are in nanoseconds. The maximum load on  $\text{-IOCS16}$  is 1LSTTL with 50pF total load. All times are in nanoseconds. Minimum time from IORDY high to  $\text{-IORD}$  high is 0 nsec, but minimum  $\text{-IORD}$  width must still be met.

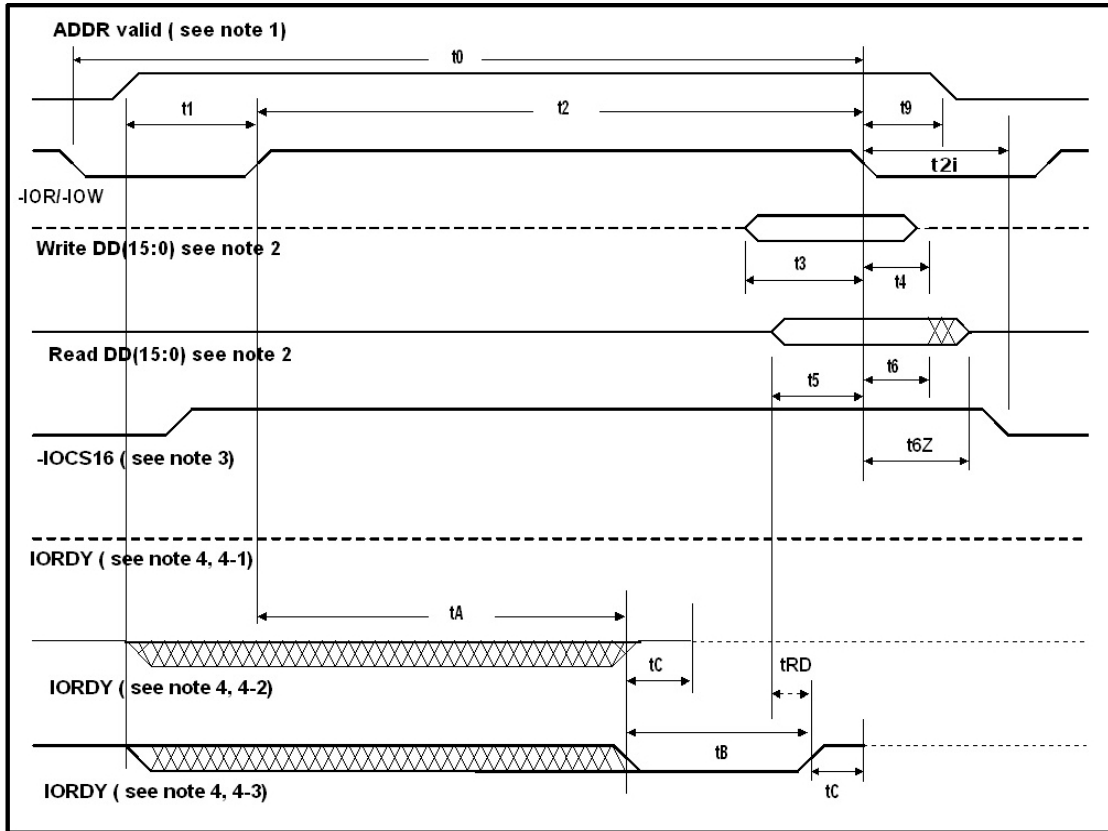

<sup>(1)</sup> t0 is the minimum total cycle time, t2 is the minimum command active time, and t2i is the minimum command recovery time or command inactive time. The actual cycle time equals the sum of the actual command active time and the actual command inactive time. The three timing requirements of t0, t2, and t2i shall be met. The minimum total cycle a time requirement is greater than the sum of t2 and t2i. This means a host implementation can lengthen either or both t2 or t2i to ensure that t0 is equal to or greater than the value reported in the device's identify drive data. A CF Card implementation shall support any legal host implementation.

<sup>(2)</sup> This parameter specifies the time from the negation edge of  $\text{-IORD}$  to the time that the CF Card (tri-state) no longer drives the data bus.

<sup>(3)</sup> The delay from the activation of  $\text{-IORD}$  or  $\text{-IOWR}$  until the state of IORDY is first sampled. If IORDY is inactive then the host shall wait until IORDY is active before the PIO cycle can be completed. If the CF Card is not driving IORDY negated at the tA after the activation of IOR or  $\text{-IOW}$ , then t5 shall be met and tRD is not applicable. If the CF Card is driving IORDY negated at the time tA after the activation of  $\text{-IOR}$  or  $\text{-IOW}$ , then tRD shall be met and t5 is not applicable.

<sup>(4)</sup> t7 and t8 apply only to modes 0, 1, and 2. For other modes, this signal is not valid.

Figure 4-8: True IDE Read/Write Timing Diagram

**Notes:**

(1) Device Address consists of signals -CS0, -CS1 and DA(2:0)

(2) Data consists of DD(16:0) (16-bit) or DD(7:0) (8-bit)

(3) -IOCS16 shown for PIO modes 0, 1, and 2. For other modes, this signal is not valid

(4) The negation of IORDY by the device is used to extend the PIO cycle. The determination of whether the cycle is to be extended is made by the host after tA from the assertion of -IOR or -IOW. The assertion and negation of IORDY are described in the following three cases:

(4-1) Device never negates IORDY: no wait is generated.

(4-2) Device starts to drive IORDY low before tA, but causes IORDY to be asserted before tA: no wait generated.

(4-3) Device drives IORDY low before tA: wait generated. The cycle completes after IORDY is reasserted. For cycles where a wait is generated and -IR is asserted, the device shall place read data on DD(15:0) for tRD before causing IORDY to be asserted.

ALL WAVEFORMS IN THE DIAGRAM ARE SHOWN WITH THE ASSERTED STATE HIGH. NEGATIVE TRUE SIGNALS APPEAR INVERTED ON THE BUS RELATIVE TO THE DIAGRAM.

## 4.0 HOST INTERFACE AND REGISTERS

This section provides the Host interface and registers for Unigen Corporation's CompactFlash card.

Unigen Corporation's CompactFlash card supports two Host modes:

- PC Card ATA Mode
- True IDE Mode

The CompactFlash card automatically senses its environment and configures itself on power-up to either the PC Card ATA Mode or the True IDE Mode. The local processor can override the configuration. In both the PC Card ATA Mode and the True IDE Modes the CompactFlash is electrically compliant with the CompactFlash specifications.

## 4.2 PC CARD ATA CONFIGURATION REGISTERS

The Card Configuration Registers described in the following sections are addressable by the Host.

### 4.2.1 Configuration Option Register

#### Attribute Memory Address 200H (Read/Write)

The Configuration Option register is used by the Host System to configure the CompactFlash card and to issue soft resets to the CompactFlash. This register is reset at system Power On and by the HRESET signal (after the CompactFlash is configured in PC Card ATA or True IDE extension mode).

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
SRESET	LevIREQ	Configuration Index. See Decode Table below					
Bit 7	R/W	<b>Soft Reset:</b> When this bit is set to a logic one, the Host Interface is in the reset state. This reset condition is the same as a hardware or power-on reset state with the exception that this bit stays set. This software reset condition is removed when this bit is reset to a logic zero. Following a power-on or hardware reset this bit is cleared.					
Bit 6	R/W	<b>Level Mode/Pulsed Mode Interrupt Request:</b> Level Mode Interrupts are selected when this bit is one. Pulsed Mode Interrupts are selected when this bit is zero. A pulsed-mode interrupt is asserted by placing an active-going (low) pulse on the interrupt line. The pulse width is at least 0.5 microseconds. A level-mode interrupt is asserted by placing the interrupt line in an active (low) state until the interrupt has been serviced by the system. The interrupt is driven in the inactive state.					
Bits 5:0	R/W	<b>Configuration Index:</b> This 6-bit field comprises the configuration index. These 6-bits are initialized after a power-on, hardware or software reset to a field of six zeroes. This places the controller in a mode to accept attribute memory accesses only. The Host system should load a non-null value into this register after scanning and parsing the tuples in the CIS. This index points to the I/O configuration this Host system requires. Certain nonzero values in this field switch the CompactFlash from Common Memory mode to I/O mode. Bits 1:0 of this register are used to directly decode the addressing option chosen by the Host system. This provides the Host with immediate access to the CompactFlash Task File after writing the Configuration Option register.					

Configuration Index Decode Table			
Bit 1	Bit 0	Selected Decode Mode	See Table
0	0	Common Memory Linear Address AT Decode	Table 7-1

1	0	1	1	Don't Care	XXX0	Odd Data (D15:D8)	Odd Data (D15:D8)
1	0	1	1	Don't Care	XXX1	Odd Data (D15:D8)	Odd Data (D15:D8)

## 4.2.2 Configuration and Status Register

### Attribute Memory Address 202H (Read/Write)

The configuration and status register is implemented in the CompactFlash to ensure that the Host interface has all status available to it on signal pins or bits in this register.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Changed	SigChg	I/Ois8	Rsvd 0	Audio	PwrDwn	Intr	Rsvd 0
Bit 7	R	Changed: This bit indicates that one or more of the Pin Replacement register bits CRdy/-Bsy (Register 204H, bit 5) or CWProt (Register 204H, bit 4) is set to one.					
Bit 6	R/W	Signal Changed Enable: This bit is set and reset by the Host to control the Signal Changed signal output (bit 7 above and -STSCHG, Pin 46 in the I/O mode). If no state change signal is required, this bit should be set to 0 and -STSCHG signal will be held high in the I/O mode.					
Bit 5	R/W	I/O is 8: This bit is used to tell a memory card that the system only accesses data using an 8-bit data path. The control for an 8-bit data access is built into the ATA command set, and still must be used.					
Bit 4	-	Reserved: The power-on state of this bit is a zero. This bit is not used and should be left as a zero.					
Bit 3	R/W	Audio/DASP: This bit is used to enable the output of the DASP* signal onto the PCMCIA Audio pin. When bit 3 is set, this signal is enabled. When bit 3 is reset, the output of this signal is disabled, and the pin is held at high-impedance. Note: In the Compact Card Interface, the bit is always set to 0, since the Compact Card does not support audio functions					
Bit 2	R/W	Power Down: This bit is used to tell a drive card to enter a Power Down mode. For storage, the Storage-Specific Power Down modes are also controlled through the ATA command set.					
Bit 1	R	Interrupt: This bit reflects the real time status of the Host Interrupt Signal pin. If interrupts are disabled by the -IEn bit in the Device Control Register.					
Bit 0	-	Reserved: This bit is reserved. This bit must be set to 0 when this register is written.					

## 4.2.3 Pin Replacement Register

### Attribute Memory Address 204H (Read/Write)

The Pin Replacement register provides status for signals on the PC Card ATA interface that are used in Memory access mode but assume a different meaning or use in I/O mode. The register may be read and written; however, when written, the lower four bits act as a mask for changing the corresponding upper four bits.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
RESERVED		CRdy/Bsy	CWProt	RESERVED		Rdy	WProt

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Bits 7:6	–	<b>Reserved:</b> These bits are reserved. These bits must be set to 0 when this register is written. In the Release 2.0 PCMCIA specification, these bits are the change notification for battery voltage.					
Bit 5	R/W	<b>Changed Rdy/–Bsy:</b> This bit is set to one when the Rdy bit (bit 1 below) changes state. The Host must clear this bit.					
Bit 4	R/W	<b>Changed Write Protect State:</b> This bit is set to one when the RWProt bit (bit 0) changes state. The Host must clear this bit.					
Bits 3:2	–	<b>Reserved:</b> These bits are reserved. These bits must be set to 0 when this register is written. In the Release 2.0 PCMCIA specification, these bits provide the battery voltage status.					
Bit 1	R/W	<b>Rdy/–Bsy:</b> This bit reflects the real time status of the Rdy/–Bsy signal. This bit may be used to determine the state of the Rdy/–Bsy signal when the pin has the Interrupt function in the PC Card ATA I/O mode. When written, this bit acts as a mask or enable to allow the corresponding bit, Changed Rdy/–Bsy to be written.					
Bit 0	R	<b>Write Protect:</b> This bit reflects the real time status of the WProt signal. This bit may be used to determine the state of the Wprot signal when the pin has the IOis16 function in the PC Card ATA I/O mode. When written, this bit acts as a mask or enable to allow the corresponding bit Changed CWProt to be written. This bit is always clear.					

## 4.2.4 Socket and Copy Register

### Attribute Memory Address 206H (Read/Write)

This Read-Write register may be used by the Host System to implement a substitute for the True IDE Master/Slave functionality. This register, if used, must be written by the system before the CompactFlash's Configuration Option register (Attribute Memory Address 200H).

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
RSVD	Copy Number			Socket Number			
Bit 7	–	This bit is reserved for future PCMCIA standardization. This bit must be set to 0 when this byte is written.					
Bits 6-4	R/W	<b>Copy Number:</b> Flash Drive's which indicate in their CIS that they support more than one copy of identically configured drive-cards, should have a copy number (0 to MAX twin cards, MAX = n-1, for the ATA protocol, n = 2) written back to this field. This feature can be used to emulate ATA Master/Slave functionality. Only 0 or 1 should be loaded into this field.					
Bits 3-0	R/W	<b>Socket Number:</b> This field indicates to the CompactFlash that it is located in the nth socket. The first socket is numbered 0.					

## 4.2.5 Summary of Host Commands

**Table 7-3: Summary of Host Commands Supported**

Command	ATA Specification Type <sup>1,2</sup>	Command Code
Check Power Mode	O	98h E5h
Erase Sectors	V	C0h
Execute Drive Diagnostic	M	90h
Format Track	M	50h
Identify Drive	O	ECh
Idle	O	97h E3h
Idle Immediate	O	95h E1h
Initialize Drive Parameters	M	91h
Read Buffer	O	E4h
Read Long Sector	M	22h 23h
Read Multiple	O	C4h
Read Sectors	M	20h 21h
Read Verify Sectors	M	40h 41h
Recalibrate	M	1xh
Request Sense	V	03
Seek	M	7xh
Set Features	O	EFh
Set Multiple Mode	O	C6h
Sleep	O	99h E6h
Standby	O	96h E2h
Standby Immediate	O	94h E0h
Translate Sector	V	87h
Wear Leveling	V	F5h
Write Buffer	O	E8h
Write Long Sector	M	32h 33h
Write Multiple	O	C5h
Write Multiple (w/o erase)	V	CDh
Write Sectors	M	30h 31h
Write Sectors (w/o erase)	V	38h
Write Verify	O	3Ch

1 Type Abbreviation: (M) indicates Mandatory; (O) indicates Optional; (V) indicates Vendor unique.

2 These type abbreviations pertain to the ATA specifications only. In the case of the CompactFlash specifications, all Host Commands listed here are Mandatory.

## 4.2.6 Detailed Description of Commands

This section details the functionality of commands supported by the CompactFlash. For each command, the Command Block register contents for the command invoked by the Host, and the Command Block registers updated by the CompactFlash after command completion, are shown. Following is an example of the command description, showing the conventions used for each command description. Throughout this document, the terms 'Task File' and 'Command Block' are used interchangeably to refer to the ATA I/O registers.

A detailed description of the execution of the command is provided. This is followed by two tables, the first showing the requirements of the Command Block registers at the time that the Host issues the command to the CompactFlash, and the second showing the contents of the Command Block after completion or termination on error of the command.

Command Block specified by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	Command Code							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer							
FEATURES	Set Features Code							

The preceding table represents the contents of the Command Block registers when the Host issues the command. Where applicable, the Host first writes the appropriate data into the Features, Sector Count, Sector Number, Cylinder Hi/Low, and Drive/Head registers, and lastly, writes the command code into the Command register. The act of writing to the command register causes the CompactFlash to execute the command based on the contents of the Command Block at that instance.

Note that bits 7 and 5 of the Drive/Head register are denoted as 'nu.' Although the Host is expected to always set these bits to 1 when the command is issued, the CompactFlash ignores the value of these bits.

Command Block specified by CompactFlash upon completion/termination of 'Sample' command								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	na	na	na	na	H[3:0] or LBA[27:24] last good sector transferred			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the last good sector transferred							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector transferred							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector transferred							
SECTOR COUNT	The number of sectors that were not transferred if an unrecoverable error occurred							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	V	V	0	V	0	V	0	0

The above table represents the contents of the Command Block registers upon completion of the command by the CompactFlash.

## Solutions for a Real Time World

At the completion of every command, specific bits in the Status register is as follows: the BuSY, Drive-WriteFault, DataReQuest, and InDeX bits are always deasserted, while the DriveReaDY, and DriveSeek-Complete bits are always asserted. The CORReCted ECC bit and the ERRor bit are set or cleared as appropriate.

The contents of the Error register are always set to zero when a command is received, and are only valid if the ERR bit in the Status register is set to '1' at the completion of a command. In addition, the MediaChange, MediaChangeRequest, TrackONotFound, and AddressMarkNotFound bits are always cleared, regardless of the state of the ERR bit in the Status register.

For the Command Block tables, explanations for each possible code are shown below:

- |                      |  |
|----------------------|--|
| L (LBA Mode bit)     | This bit is used to specify whether the requested sector is addressed in the LBA mode or in the Cylinder-Head-Sector, CHS, mode. When set, the LBA mode is specified. The LBA is comprised of the lower significant nibble in the Drive/Head register, LBA [27:24], concatenated with the contents of the Cylinder Hi/Lo, and the Sector registers, LBA [23:0], respectively. If L=0, the sector is addressed in the classic Cylinder/Head/Sector CHS mode.  |
| D (Drive Select bit) | This bit is used to select card 0 or 1, allowing up to two cards to share a single Task File. If two PC Card ATA cards are present in the system, one of the cards may be assigned as copy 0, and the second card may be assigned as copy 1, using the Copy field of the PCMCIA Socket & Copy card configuration register. In this case, the card designated as Copy 0 is selected when D=0. Conversely, the card designated as Copy 1 is selected when D=1. |
| 1 (Bit is Set)       | When referring to the Command Block registers when the Host issues a command, this bit must be set to a 1 by the Host before command invocation.<br><br>When referring to the Command Block contents read by the Host after completion of a command, the CompactFlash upon command completion sets this bit.   |
| 0 (Bit is Cleared)   | When referring to the Command Block registers when the Host issues a command, this bit must be cleared to 0 by the Host before command invocation. When referring to the Command Block contents read by the Host after completion of a command, the CompactFlash upon command completion clears this bit.  |
| nu (Not Used)        | Although the Host may specify this register/bit when invoking the command, the value for this command block register or bit is ignored by the card.  |
| V (Valid Data)       | When referring to the Command Block contents read by the Host after completion of a command, the value for the applicable bit is specified by the card.  |
| na (Not Affected)    | The value for this bit, or register, is neither set nor cleared by the card; i.e., it is unchanged by the card after command completion.   |

## 4.2.7 Check Power Mode

Although this command is supported for backward compatibility, it has no actual function. The card always returns the In Idle mode code 'FFh' in the Sector Count register, in response to this command. Command completion status always indicates command completed with no error.

Check Power Mode Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	98h/E5h							
DRIVE/HEAD	Nu	nu	nu	D	Nu			
CYLINDER HI	Nu							
CYLINDER LOW	Nu							
SECTOR NUM	Nu							
SECTOR COUNT	Nu							
FEATURES	Nu							

Command Block specified by CompactFlash upon completion/termination of Check Power Mode command (98h/E5h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	0
DRIVE/HEAD	Na	na	na	na	Na			
CYLINDER HI	Na							
CYLINDER LOW	Na							
SECTOR NUM	Na							
SECTOR COUNT	Power Mode Code is always FFh							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	0	0	0	0	0	0	0

## 4.2.8 Erase Sectors

This command erases the number of sectors specified in the Sector Count register, starting at the sector specified by the Cylinder, Head, and Sector Number registers in the Task File.

Erase Sectors Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	C0h							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to eraser							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to eraser							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to erase							
SECTOR COUNT	The number of sectors/logical blocks to erase							
FEATURES	Nu							

Command Block specified by Flash upon completion/termination of Erase Sectors command (C0h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	V	1	0	0	0	V
DRIVE/HEAD	na	L	na	Na	H[3:0] or LBA[27:24] last good sector erased			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the last good sector erased							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector erased							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector erased							
SECTOR COUNT	The number of sectors that were not erased if an unrecoverable error occurred							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	0	0	V	0	0	0	0

## 4.2.9 Execute Drive Diagnostic

This command performs self-diagnostics on various internal components of the CompactFlash. Results of the test are reported in the Error register. Note that the bit definitions for the Error register do not apply in this command; rather, the value in the Error register is a diagnostic code, defined in the Table below.

Execute Drive Diagnostics Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	90h							
DRIVE/HEAD	Nu	Nu	nu	D	Nu			
CYLINDER HI	Nu							
CYLINDER LOW	Nu							
SECTOR NUM	Nu							
SECTOR COUNT	Nu							
FEATURES	Nu							

Command Block specified by CompactFlash upon completion/termination of Execute Drive Diagnostics command (90h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	na	na	na	na	na			
CYLINDER HI	Na							
CYLINDER LOW	Na							
SECTOR NUM	Na							
SECTOR COUNT	Na							
ERROR	Diagnostic Code. See Table below							

Execute Drive Diagnostic Return Codes	
Code	Description
01h	No error detected
02h	Formatter device error
03h	Sector buffer error
04h	ECC logic error
05h	Controller microprocessor error
8xh	Slave Error3

## 4.2.10 Format Track

This command erases 32 sectors starting at the sector specified by the Cylinder, Head, and Sector Number parameters in the task file. If the sector is not valid, an IDNF (ID Not Found) bit is set in the Error register and the command terminates.

In CHS mode, the number of sectors to format per track is set to the number of Current Sectors per Track in the Identify Drive data, by default 20h. Otherwise, it is set to the number of sectors per track by the Initialize Drive Parameters command.

In LBA mode, the number of sectors to format per track is specified by the Host in the Sector Count register. For backward compatibility, the CompactFlash accepts one sector of data from the Host. This data is not used.

Format Track Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	50h							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	[LBA mode only] LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	[LBA mode only] The number of sectors to be formatted on the track.							
FEATURES	Nu							

Command Block specified by CompactFlash upon completion/termination of Format Track command (50h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	na	na	na	na	Na			
CYLINDER HI	Na							
CYLINDER LOW	Na							
SECTOR NUM	Na							
SECTOR COUNT	Na							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	0	0	0	0	V	0	0

3 Valid only if CompactFlash is in True IDE Mode.

## 4.2.11 Identify Drive

This command passes to the Host one sector of data describing the CompactFlash's parameters. See Table below for a detailed description of the Identify Drive data.

Identify Drive Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	ECh							
DRIVE/HEAD	nu	nu	nu	D	nu			
CYLINDER HI	nu							
CYLINDER LOW	nu							
SECTOR NUM	nu							
SECTOR COUNT	nu							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Identify Drive command (ECh)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	0	0	0
DRIVE/HEAD	na	na	na	Na	na			
CYLINDER HI	na							
CYLINDER LOW	na							
SECTOR NUM	na							
SECTOR COUNT	na							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	0	0	0	0	0	0	0

## 4.2.12 Identify Drive Information

Word Address	Default Value	Total Bytes	Data Field Type Information
0	848Ah* 045Ah**	2	General configuration – signature for the CompactFlash Storage Card (* CF mode and ** IDE mode)
1	XXXXh	2	Default number of cylinders
2	0000h	2	Reserved
3	00XXh	2	Default number of heads
4	XXXXh	2	Number of unformatted bytes per track
5	XXXXh	2	Number of unformatted bytes per sector
6	XXXXh	2	Default number of sectors per track
7-8	XXXXh	4	Number of sectors per card (word 7 = MSW, Word 8 = LSW)
9	XXXXh	2	Vendor Unique
10-19	aaaa	20	Serial number in ASCII (Right Justified)
20	XXXXh	2	Buffer type
21	XXXXh	2	Buffer size in 512 byte increments

Word Address	Default Value	Total Bytes	Data Field Type Information
22	0004h	2	# of ECC bytes passed on Read/Write Long Commands
23-26	aaaa	8	Firmware revision in ASCII. Big Endian Byte Order in Word
27-46	aaaa	40	Model number in ASCII (Left Justified) Big Endian Byte Order in Word
47	XXXX	2	Maximum number of sectors on Read/Write Multiple command
48	0000h	2	Double Word not supported
49	XX00h	2	Capabilities
50	0000h	2	Reserved
51	0X00h	2	PIO data transfer cycle timing mode
52	0000h	2	DMA data transfer cycle timing mode
53	0001h	2	Translation parameters are valid
54	XXXXh	2	Current numbers of cylinders
55	XXXXh	2	Current numbers of heads
56	XXXXh	2	Current sectors per track
57-58	XXXXh	4	Current capacity in sectors (LBAs) (Word 57 = LSW, Word 58 = MSW)
59	010X	2	Multiple sector setting
60-61	XXXXh	4	Total number of sectors addressable in LBA Mode
62	0000h	2	Reserved
63	0000h* 0407h**	2	Multiword DMA transfer. In PC Card modes this value shall be 0h (* No DMA and ** with DMA)
64	0003h	2	Advanced PIO modes supported
65	0000h* 0078h**	2	Minimum Multiword DMA transfer cycle time per word. In PC Card modes this value shall be 0h (* No DMA and ** with DMA)
66	0000h* 0078h**	2	Recommended Multiword DMA transfer cycle time. In PC Card modes this value shall be 0h (* No DMA and ** with DMA)
67	0078h	2	Minimum PIO transfer cycle time without flow control
68	0078h	2	Minimum PIO transfer time with IORDY flow control
69-79	0000h	20	Reserved
80-81	0000h	4	Reserved – CF cards do not return an ATA version
82-84	0000h	6	Features/command sets supported
85-87	0000h	6	Features/command sets enabled
88	0000h	2	Ultra DMA Mode Supported and Selected
89	0000h	2	Time required for Security erase unit completion
90	0000h	2	Time required for Enhanced security erase unit completion
91	0000h	2	Current Advanced power management value
92-127	0000h	72	Reserved
128	XXXXh	2	Security status
129-159	0000h	64	Vendor unique bytes
160	XXXXh	2	Power requirement description
161-255	0000h	170	Reserved

## 4.2.13 Idle

Although this command is supported for backward compatibility, it has no actual function. The card always returns good status at the completion of this command.

Idle Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	97h/E3h							
DRIVE/HEAD	nu	nu	nu	D	nu			
CYLINDER HI	nu							
CYLINDER LOW	nu							
SECTOR NUM	nu							
SECTOR COUNT	Time-out Parameter. This parameter is ignored by the card.							
FEATURES	Nu							

Command Block specified by CompactFlash upon completion/termination of Idle command (97h/E3h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	0
DRIVE/HEAD	na	na	na	na	na

ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	0	0	0	0	0	0	0

## 4.2.15 Initialize Drive Parameters

This command allows the Host to alter the number of sectors per track and the number of heads per cylinder. This enables Translation Mode, which maps the flash storage using the altered parameters. On Host Reset, the default is 32 Sectors per Track and 8 Heads per Cylinder. The current values used for mapping are returned in the Identify Drive command as Number of Current Sectors per Track, and Number of Current Heads.

Initialize Drive Parameters Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	91h							
DRIVE/HEAD	nu	nu	nu	D	Number of Heads per Cyl minus 1			
CYLINDER HI	nu							
CYLINDER LOW	nu							
SECTOR NUM	nu

ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	0	0	0	0	0	0	0

## 4.2.17 Read Long Sector

This command is similar to the Read Sectors command except the contents of the Sector Count register are ignored and only one sector is read. The 512 data bytes and 4 ECC bytes are read into the buffer (with no ECC correction) and then transferred to the Host.

Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	22h (retries enabled) -or- 23h (retries disabled)							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the sector/LBA to transfer			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer. This should be set to 01 for compatibility							
FEATURES	Nu							

Command Block specified by CompactFlash upon completion/termination of Read Long command (22h/23h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR

	0	0	0	V	0	0	0	0

## 4.2.18 Read Multiple

The R/W Multiple commands have to be enabled by a previous valid Set Multiple command. Once enabled, the Read Multiple command is identical to Read Sectors operation, except that the number of sectors as specified in the most recent Set Multiple command is transferred as a block to the Host without intervening Host handshaking. This number of sectors to transfer as a block is referred to as the block count. Although the Set Multiple, and R/W Multiple commands are supported, the only valid block count is one.

If Read Multiple has not been enabled, the ABRT (Aborted Command) bit is set in the Error register and the command terminates.

Read Multiple Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
	C4h							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer

## 4.2.19 Read Sectors

This command transfers data from the CompactFlash to the Host. Data transfer starts at the sector specified by the Cylinder, Head, and Sector Number registers in the Task File, and proceeds for the number of sectors specified in the Sector Count register.

Read Sectors Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	20h (retries enabled) -or- 21h (retries disabled)							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Read Sectors command (20h/21h)								
Task File Register	7	6	5	4	3	2	1	0

CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector transferred							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector transferred							
SECTOR COUNT	The number of sectors that were not transferred if an unrecoverable error occurred							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	V	0	V	0	0	0	0

## 4.2.20 Read Verify Sectors

The Read Verify Sectors command verifies one or more sectors on the card by transferring data from the Flash media to the data buffer in the card and verifying that the ECC is correct. It is performed identically to the Read Sectors command, except that DRQ is not asserted, and no data is transferred to the Host. If

# CompactFlash<sup>®</sup> - UGB30SHS

## Solutions for a Real Time World

an uncorrectable error occurs, the read verify is terminated at the failing sector. The Command Block registers contain the CHS, or LBA of the sector in which the error occurred.

Read Verify Sectors Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	40h (retries enabled) -or- 41h (retries disabled)							
DRIVE/HEAD	Nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to verify							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to verify							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to verify							
SECTOR COUNT	The number of sectors/logical blocks to verify							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Read Verify Sectors command (40h/41h)								
Task File Register	7	6	5	4	3	2	1	0

	0	0	0	0	0	0	0	0

## 4.2.22 Request Sense

This command returns an extended error code for the previous command, which ended with an error. Table below defines and describes the contents of the Error register on completion of the Request Sense command.

Request Sense Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	03h							
DRIVE/HEAD	Nu	nu	nu	D	nu			
CYLINDER HI	nu							
CYLINDER LOW	nu							
SECTOR NUM	nu							
SECTOR COUNT	nu							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Request Sense command 03h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	0
DRIVE/HEAD	Na	na	na	na	na			
CYLINDER HI	na							
CYLINDER LOW	na							
SECTOR NUM	na							
SECTOR COUNT	na							
ERROR	See Table below							

Extended Error Codes	
Extended Error Code	Description
00h	No error detected
01h	Self test OK (no error)
09h	Miscellaneous error
20h	Invalid command
21h	Invalid address (Requested Head or Sector invalid)
2Fh	Address overflow (Address too large)
35h, 36h	Supply or generated voltage out of tolerance
11h	Uncorrectable ECC error
18h	Corrected ECC error
05h, 30-34h, 37h, 3Eh	Self test or diagnostic failed
10h, 14h	ID not found

Extended Error Codes	
Extended Error Code	Description
3Ah	Spare sectors exhausted
1Fh	Data transfer error/Aborted command
0Ch, 38h, 3Bh, 3Ch, 3Fh	Corrupted media format
03h	Write/Erase failed

## 4.2.23 Seek

This command is supported for backward compatibility. Although this command has no actual function, it does perform a range check of valid track, and posts an IDNF error if the Head or Cylinder specified are out of bounds.

Seek Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	7xh							
DRIVE/HEAD	Nu	L	nu	D	H[3:0] or LBA[27:24] of the track			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the track							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the track							
SECTOR NUM	(Valid in LBA mode only) LBA[7:0] of the track							
SECTOR COUNT	nu							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Seek command (7xh)

SECTOR COUNT	na							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TK0NF	AMNF
	0	0	0	V	0	0	0	0

## 4.2.24 Set Features

This command allows the Host to control various card features. Each feature is selected by passing its feature code in the Features register. Certain features use additional information passed in the Sector Count register. If the Feature register contains a feature code that is not supported, the drive will respond by setting the Error bit in the Status register and the Abort bit in the Error register.

Set Features Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	EFh							
DRIVE/HEAD	Nu	nu	nu	D	nu			
CYLINDER HI	nu							
CYLINDER LOW	nu							
SECTOR START	nu							
SECTOR COUNT	nu (additional info if features code is 97h or 9Ah)							
FEATURES	Feature Code. See Table on page [...]							

Command Block specified by CompactFlash upon completion/termination of Set Features command (EFh)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	0	0	0	V
DRIVE/HEAD	Na	na	na	na	na			
CYLINDER HI	na (8: maximum current divided by 4 if feature code is 9Ah)							
CYLINDER LOW	na (2: minimum current divided by 4 if feature code is 9Ah)							
SECTOR	Na							
SECTOR COUNT	Na							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	0	0	0	0	V	0	0

Valid Feature Codes	
Code	Feature
01h	Enable 8-bit data transfers
44h	NOP; accepted for backward compatibility
55h	NOP; accepted for backward compatibility
66h	Disable restoration of default features with Soft Reset
69h	NOP; accepted for backward compatibility
81h	Disable 8-bit data transfer

Valid Feature Codes	
Code	Feature
96h	NOP; accepted for backward compatibility
97h	Control clock using value in Sector Count register
9Ah	Control current using value in Sector Count register
Aah	NOP; accepted for backward compatibility
BBh	NOP; accepted for backward compatibility
CCh	Enable restoration of default features with Soft Reset

**NOTES**

Feature codes 01h and 81h controls Host transfer data width. By default, 8-bit transfers are disabled.

Feature codes 44h, 55h, 69h, 96h, AAh, and BBh are supported for backward compatibility and have no function.

Feature codes 66h and CCh control whether or not a Soft Reset restores any feature codes to their Power On default value. The features effected are 81h (8-bit transfer), 97h (clock control), and 9A (current control). By default, a Soft Reset will restore the default features.

Feature codes 97h and 9Ah are used to control the card's power and performance. They are mutually exclusive; each feature code will overwrite the power/performance features set by the other command.

Feature codes 97h controls the card's internal clock using the value set in the Sector Count register. See Table below. The default value is 0Fh.

Sector Count Code Specifying CompactFlash's Internal Clock Rate	
Sector Count Register Value	Function
00h	Lowest power/slowest performance
0Ah	Intermediate power and performance
0Bh	Intermediate power and performance
0Eh	Highest power/fastest performance
0Fh	Highest power/fastest performance

Feature code 9Ah enables the card to self-configure to best meet the Host system's power requirements. The Host sets a value in the Sector Count register that is equal to one-fourth of the desired maximum average current (in mA) that the card should consume. For example, if the Sector Count register is set to 6, the card will self-configure to provide the best possible performance without exceeding 24 mA. Upon completion of the command, the card responds to the Host with the range of values supported by the card. The minimum value is set in the Cylinder Low register, and the maximum value is set in the Cylinder Hi register. The card will accept values outside this programmable range, but will operate either at the lowest power or highest performance as appropriate.

## 4.2.25 Set Multiple

This command is used either to set the block count (number of sectors per block), simultaneously enabling R/W Multiple command support, or to disable support of R/W Multiple commands. Although setting, reading, and writing blocks are supported, the only valid block count is one. If the block count specified by the Host is greater than one, the command is aborted. The ERR bit in the Status register is set, and the ABRT bit in the Error register is set. In addition, Read Multiple and Write Multiple commands are disabled.

If the content of the Sector Count register is '1', Read Multiple and Write Multiple commands are enabled until the next Host RESET. Invoking this command with Sector Count = 0 disables R/W Multiple commands. In this case, the CompactFlash card aborts all subsequent R/W Multiple commands issued by the Host.

Set Multiple Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	C6h							
DRIVE/HEAD	Nu	nu	nu	D	nu

## 4.2.31 Write Buffer

This command transfers 512 bytes of data from the Host to the first page of the data buffer.

Write Buffer Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	E8h							
DRIVE/HEAD	nu	nu	nu	D	nu			
CYLINDER HI	nu							
CYLINDER LOW	nu							
SECTOR NUM	nu							
SECTOR COUNT	nu							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Write Buffer command (E8h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	0
DRIVE/HEAD	na	na	na	na	na			
CYLINDER HI	na							
CYLINDER LOW	na							
SECTOR NUM	na							
SECTOR COUNT	na							

Command Block specified by CompactFlash upon completion/termination of Write Buffer command (E8h)								
Task File Register	7	6	5	4	3	2	1	0
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	0	0	0	0	0	0	0	0

## 4.2.32 Write Long (with and without retry)

This command is similar to the Write Sectors command except the contents of the Sector Count register are ignored and only one sector is written. The 512 data bytes and 4 ECC bytes are transferred from the Host and then written from the buffer to the flash.

Write Long Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	32h (retries enabled) -or- 33h (retries disabled)							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer. Should be set to 1 for compatibility.							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Write Long command (32h/33h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	na	L	na	na	H[3:0] or LBA[27:24] last good sector transferred			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the last good sector transferred							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector transferred							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector transferred							
SECTOR COUNT	1 if an unrecoverable error occurred, 0 if the command proceeded successfully							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	V	0	0	V	0	0	0	V0

## 4.2.33 Write Multiple

The R/W Multiple commands have to be enabled by a previous valid Set Multiple command. Once enabled, the Write Multiple command is identical to Write Sectors operation, except that the number of sectors as specified in the most recent Set Multiple command is transferred as a block from the Host without intervening Host handshaking. This number of sectors to transfer as a block is referred to as the block count. Although the Set Multiple and R/W Multiple commands are supported, the only valid block count is one. If Write Multiple has not been enabled, the ABRT (Command Aborted) bit is set in the Error register and the command terminates.

Write Multiple Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	C5h							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer							
FEATURES	Nu							

Command Block specified by CompactFlash upon completion/termination of Write Multiple command (C5h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	na	L	na	na	H[3:0] or LBA[27:24] last good sector transferred			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the last good sector transferred							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector transferred							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector transferred							
SECTOR COUNT	The number of sectors that were not transferred if an unrecoverable error occurred							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TK0NF	AMNF
	V	0	0	V	0	0	0	0

## 4.2.34 Write Multiple without Erase

This command is supported for backward compatibility. The actual function performed is identical to the Write Multiple command.

Write Multiple without Erase Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	CDh							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Write Multiple without Erase command (CDh)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	Na	L	na	na	H[3:0] or LBA[27:24] last good sector transferred			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the last good sector transferred							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector transferred							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector transferred							
SECTOR COUNT	The number of sectors that were not transferred if an unrecoverable error occurred							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	V	0	0	V	0	0	0	0

## 4.2.35 Write Sectors (with and without retry)

This command transfers data from the Host to the CompactFlash. Data transfer starts at the sector specified by the Cylinder, Head, and Sector Number registers in the Task File, and proceeds for the number of sectors specified in the Sector Count register. If the address of the starting sector is not within the range of addresses supported by this card, the IDNF (ID Not Found) bit is set in the Error register and the command terminates.

Write Sectors Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	30h (retries enabled) -or- 31h (retries disabled)							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			

Write Sectors Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Write Sectors command (30h/31h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	na	L	na	na	H[3:0] or LBA[27:24] last good sector transferred			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the last good sector transferred							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector transferred							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector transferred							
SECTOR COUNT	The number of sectors that were not transferred if an unrecoverable error occurred							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	V	0	0	V	0	0	0	0

## 4.2.36 Write Sectors without Erase

This command is supported for backward compatibility. The actual function performed is identical to the Write Sectors (with retry) command.

Write Sectors w/o Erase Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	C8h							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Write Sectors w/o Erase command (C8h)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	na	L	na	na	H[3:0] or LBA[27:24] last good sector transferred			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the last good sector transferred							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector transferred							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector transferred							
SECTOR COUNT	The number of sectors that were not transferred if an unrecoverable error occurred							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	V	0	0	V	0	0	0	0

## 4.2.37 Write Verify

This command is similar to the write sectors (without retry) command except that each sector is verified after being written.

Write Verify Command Issued by Host								
Task File Register	7	6	5	4	3	2	1	0
COMMAND	3Ch							
DRIVE/HEAD	nu	L	nu	D	H[3:0] or LBA[27:24] of the starting sector/LBA			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the first sector/LBA to transfer							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the first sector/LBA to transfer							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the first sector/LBA to transfer							
SECTOR COUNT	The number of sectors/logical blocks to transfer							
FEATURES	nu							

Command Block specified by CompactFlash upon completion/termination of Write Verify command (3Ch)								
Task File Register	7	6	5	4	3	2	1	0
	BSY	DRDY	DWF	DSC	DRQ	CORR	IDX	ERR
STATUS	0	1	0	1	V	V	0	V
DRIVE/HEAD	na	L	na	na	H[3:0] or LBA[27:24] last good sector transferred			
CYLINDER HI	Cylinder[15:8] or LBA[23:16] of the last good sector transferred							
CYLINDER LOW	Cylinder[7:0] or LBA[15:8] of the last good sector transferred							
SECTOR NUM	Sector[7:0] or LBA[7:0] of the last good sector transferred							

Command Block specified by CompactFlash upon completion/termination of Write Verify command (3Ch)								
Task File Register	7	6	5	4	3	2	1	0
SECTOR COUNT	The number of sectors that were not transferred if an unrecoverable error occurred							
ERROR	BBK	UNC	MC	IDNF	MCR	ABRT	TKONF	AMNF
	V	0	0	V	0	0	0	0

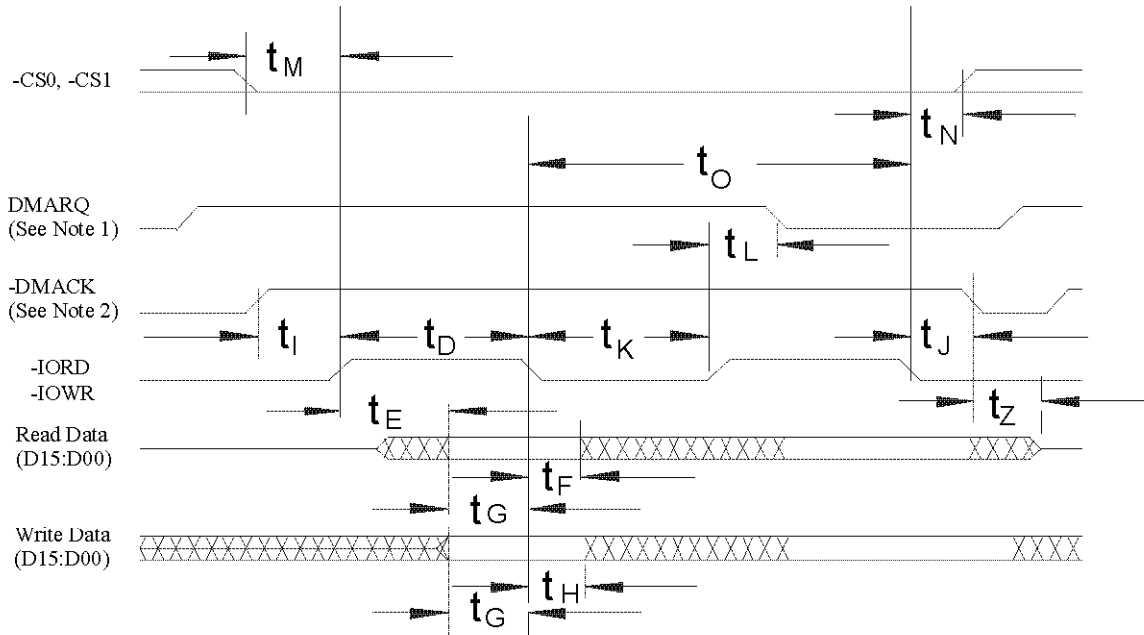

## 4.3 MULTI WORD DMA TIMING

### True IDE Multiword DMA Mode Read/Write Timing

	Item	Mode 0 (ns)	Mode 1 (ns)	Mode 2 (ns)	Note
$t_0$	Cycle time (min)	480	150	120	1
$t_D$	-IOR <sub>D</sub> / -IOW <sub>R</sub> asserted width (min)	215	80	70	1
$t_E$	-IOR <sub>D</sub> data access (max)	150	60	50	
$t_F$	-IOR <sub>D</sub> data hold (min)	5	5	5	
$t_G$	-IOR <sub>D</sub> /-IOW <sub>R</sub> data setup (min)	100	30	20	
$t_H$	-IOW <sub>R</sub> data hold (min)	20	15	10	
$t_I$	DMACK to -IOR <sub>D</sub> /-IOW <sub>R</sub> setup (min)	0	0	0	
$t_J$	-IOR <sub>D</sub> / -IOW <sub>R</sub> to -DMACK hold (min)	20	5	5	
$t_{KR}$	-IOR <sub>D</sub> negated width (min)	50	50	25	1
$t_{KW}$	-IOW <sub>R</sub> negated width (min)	215	50	25	1
$t_{LR}$	-IOR <sub>D</sub> to DMARQ delay (max)	120	40	35	
$t_{LW}$	-IOW <sub>R</sub> to DMARQ delay (max)	40	40	35	
$t_M$	CS(1:0) valid to -IOR <sub>D</sub> / -IOW <sub>R</sub>	50	30	25	
$t_N$	CS(1:0) hold	15	10	10	
$t_Z$	-DMACK	20	25	25	

Notes: 1)  $t_0$  is the minimum total cycle time and  $t_D$  is the minimum command active time, while  $t_{KR}$  and  $t_{KW}$  are the minimum command recovery time or command inactive time for input and output cycles respectively. The actual cycle time equals the sum of the actual command active time and the actual command inactive time. The three timing requirements of  $t_0$ ,  $t_D$ ,  $t_{KR}$ , and  $t_{KW}$  shall be met. The minimum total cycle time requirement is greater than the sum of  $t_D$  and  $t_{KR}$  or  $t_{KW}$ , for input and output cycles respectively. This means a host implementation can lengthen either or both of  $t_D$  and either of  $t_{KR}$ , and  $t_{KW}$  as needed to ensure that  $t_0$  is equal to or greater than the value reported in the device's identify device data. A CompactFlash Storage Card implementation shall support any legal host implementation.

Notes:

- (1) If the Card cannot sustain continuous, minimum cycle time DMA transfers, it may negate DMARQ within the time specified from the start of a DMA transfer cycle to suspend the DMA transfers in progress and reassert the signal at a later time to continue the DMA operation.
- (2) This signal may be negated by the host to suspend the DMA transfer in progress.

**ALL WAVEFORMS IN THIS DIAGRAM ARE SHOWN WITH THE ASSERTED STATE HIGH. NEGATIVE TRUE SIGNALS APPEAR INVERTED ON THE BUS RELATIVE TO THE DIAGRAM.**
