SIERRA
WIRELESS®

4111992

8.3

January 10, 2014

Important Notice

Due to the nature of wireless communications, transmission and reception of data can never be guaranteed. Data may be delayed, corrupted (i.e., have errors) or be totally lost. Although significant delays or losses of data are rare when wireless devices such as the Sierra Wireless modem are used in a normal manner with a well-constructed network, the Sierra Wireless modem should not be used in situations where failure to transmit or receive data could result in damage of any kind to the user or any other party, including but not limited to personal injury, death, or loss of property. Sierra Wireless accepts no responsibility for damages of any kind resulting from delays or errors in data transmitted or received using the Sierra Wireless modem, or for failure of the Sierra Wireless modem to transmit or receive such data.

Safety and Hazards

Do not operate the Sierra Wireless modem in areas where cellular modems are not advised without proper device certifications. These areas include environments where cellular radio can interfere such as explosive atmospheres, medical equipment, or any other equipment which may be susceptible to any form of radio interference. The Sierra Wireless modem can transmit signals that could interfere with this equipment. Do not operate the Sierra Wireless modem in any aircraft, whether the aircraft is on the ground or in flight. In aircraft, the Sierra Wireless modem **MUST BE POWERED OFF**. When operating, the Sierra Wireless modem can transmit signals that could interfere with various onboard systems.

Note: Some airlines may permit the use of cellular phones while the aircraft is on the ground and the door is open. Sierra Wireless modems may be used at this time.

The driver or operator of any vehicle should not operate the Sierra Wireless modem while in control of a vehicle. Doing so will detract from the driver or operator's control and operation of that vehicle. In some states and provinces, operating such communications devices while in control of a vehicle is an offence.

Limitations of Liability

This manual is provided "as is". Sierra Wireless makes no warranties of any kind, either expressed or implied, including any implied warranties of merchantability, fitness for a particular purpose, or noninfringement. The recipient of the manual shall endorse all risks arising from its use.

The information in this manual is subject to change without notice and does not represent a commitment on the part of Sierra Wireless. SIERRA WIRELESS AND ITS AFFILIATES SPECIFICALLY DISCLAIM LIABILITY FOR ANY AND ALL DIRECT, INDIRECT, SPECIAL, GENERAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES INCLUDING, BUT NOT LIMITED TO, LOSS OF PROFITS OR REVENUE OR ANTICIPATED PROFITS OR REVENUE ARISING OUT OF THE USE OR INABILITY TO USE ANY SIERRA WIRELESS PRODUCT, EVEN IF SIERRA WIRELESS AND/OR ITS AFFILIATES HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES OR THEY ARE FORESEEABLE OR FOR CLAIMS BY ANY THIRD PARTY.

Notwithstanding the foregoing, in no event shall Sierra Wireless and/or its affiliates aggregate liability arising under or in connection with the Sierra Wireless product, regardless of the number of events, occurrences, or claims giving rise to liability, be in excess of the price paid by the purchaser for the Sierra Wireless product.

Customer understands that Sierra Wireless is not providing cellular or GPS (including A-GPS) services. These services are provided by a third party and should be purchased directly by the Customer.

SPECIFIC DISCLAIMERS OF LIABILITY: CUSTOMER RECOGNIZES AND ACKNOWLEDGES SIERRA WIRELESS IS NOT RESPONSIBLE FOR AND SHALL NOT BE HELD LIABLE FOR ANY DEFECT OR DEFICIENCY OF ANY KIND OF CELLULAR OR GPS (INCLUDING A-GPS) SERVICES.

Patents

This product may contain technology developed by or for Sierra Wireless Inc.

This product includes technology licensed from QUALCOMM®.

This product is manufactured or sold by Sierra Wireless Inc. or its affiliates under one or more patents licensed from InterDigital Group and MMP Portfolio Licensing.

Document History

Version	Date	Updates
001	December 2010	Created document
002	April 2011	Overall review and update
003	September 2011	Updated number of consecutive resets in: • 3.8 SED (Smart Error Detection) • Table 22 USIM Interface Signals • Table 48 POWER_ON_N Signal Timing Parameters
4.0	November 28, 2011	Removed section 4.3 (redundant section – reference schematics are available in section 14 Signal Reference Schematics).
		Added: • SL8080B information • Section 5.7.3 LED Status • Section 2.2.2 Operating System (Open AT Application Framework Support) • Open AT Application Framework support information throughout the document
	December 07, 2011	Updated: • Figure 10 SL808x, SL808xT and SL808xBT Device Pinouts • Table 8 Available Interfaces and Signals • Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments • Section 4.4 Serial Peripheral Interface (SPI) • Table 28 RF Interface Features • Table 32 Audio Interface Features • Table 45 Available Signals • Table 67 1.8 V Connector Pins • Table 70 Averaged Call Mode Data DC Power Consumption^a
4.1	January 10, 2012	Updated UART1 data rates in Table 18 UART1 Interface Features
4.2	January 11, 2012	Updated pin numbers in Table 14 GPIO Pin Descriptions
4.3	January 11, 2012	Added a note after Table 24 USB 2.0 Interface Features
4.4	February 08, 2012	Updated Table 80 Standards Conformity for the SL808x, SL808xT and SL808xBT Module
4.4	February 10, 2012	Updated the document's reference number, and legal boilerplates
5.0	March 01, 2012	Fixed formatting in Table 69 Averaged Standby DC Power Consumption to display all consumption values.
6.0	July 09, 2012	Added section 4.5 I ² C Bus
		Updated: • Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments • Table 18 UART1 Interface Features • Table 69 Averaged Standby DC Power Consumption
7.0	September 04, 2012	Added Band 6 (UMTS800) support for SL8084 and SL8085.

Version	Date	Updates
8.0	May 15, 2013	Added information for SL808xT and SL808xBT
		Updated: - Figure 3 Dimensioned View - Section 3.5 Labeling - Section 1.7.1 RoHS Directive Compliant - Note in section 4.8.4.1 Standalone GPS - SIM interface in section 14 Signal Reference Schematics - Figure 37 4-wire Main Serial Interface (UART1) for SL808x, SL808xT or SL808xBT
		Deleted 8-wire support for UART
	July 12, 2013	Added additional GPIOs; updated: - Figure 10 SL808x, SL808xT and SL808xBT Device Pinouts - Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments - Table 14 GPIO Pin Descriptions - Table 19 Serial Port High-Speed UART1 Interface - Table 55 Wake Signal Pin Description - Table 56 Wireless Disable Signal Features - Table 60 Buzzer Output Pin Description - Table 62 LED_FLASH Pin Description
		Added a note after Figure 7, Figure 8, and Figure 9 to specify which variants do not support GPS.
	July 24, 2013	Added Figure 4 PCB Footprint
8.1	July 25, 2013	Updated: 1 Introduction - Table 2 Modern Features - Figure 1 Functional Architecture 2.2.2 Operating System (Open AT Application Framework Support) - Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments 4.4 Serial Peripheral Interface (SPI) 4.8.4.6 Software
8.2	October 29, 2013	Removed: - CDC compliance from Table 24 USB 2.0 Interface Features - I²C Support
		Updated Table 69 Averaged Standby DC Power Consumption
	November 13, 2013	Updated 4.10.2.1 MIC Microphone Input
		Added section 5.7.3 LED Status
		Added back 8-wire UART support for SL808x variants.
8.3	December 02, 2013	Removed unavailable variants
	January 10, 2014	Added: - Table 72 GPS Power Consumption - Reference documents for Open AT Application Framework support
		Updated Figure 4 PCB Footprint

1. Introduction

The AirPrime SL808x, SL808xT and SL808xBT module¹ is a 74-pin soldered-down module. Its wireless UMTS-based modem provides (as listed in Table 1 Supported Bands/Connectivity) data connectivity on HSDPA, WCDMA, EDGE, and GPRS networks, and, for specific devices, GPS and voice functionality.

Also, the AirPrime SL808xT and SL808xBT modules support the Open AT Application Framework, the world's most comprehensive cellular development environment which allows embedded standard ANSI C applications to be natively executed directly on the module. For more information about the Open AT Application Framework, refer to the references listed in section 15 References.

Note that this document only covers the AirPrime SL808x, SL808xT and SL808xBT module and does not cover the programmable capabilities available through the Open AT Application Framework.

¹ SL808x, SL808xT and SL808xBT refers to the following variants: SL8080, SL8080B, SL8080T, SL8081, SL8082, SL8082T, SL8082BT, SL8083, SL8084, SL8084T and SL8085

1.1. General Features

The following table lists several AirPrime SL808x, SL808xT and SL808xBT module features.

Table 2. Modern Features

Feature	Description
Physical	• Small form factor (74-pin solderable pad LGA)—25mm x 30mm x 2.35mm (nominal) • Complete body shielding • Embedded SIM available (SIM integrated at component level) • RF connection pads—Tx/Rx (all modems) and GPS (Voice/GPS modems only) • Baseband signals connection
Electrical	• Single supply voltage (VCC)—3.3V–4.3V • Complete body shielding—No additional shielding required
SMS	• Send and receive (mobile originate and mobile terminate) ▪ Mobile-originated / terminated over CS and PS channels ▪ Mobile-originated SMS over PS falls back to CS if PS service is not available, or there is a PS network failure. • New message notification • Message sorting • Multiple recipients • Return voice call • Save contact details • Mobile-originated SMS e-mail • Mobile-originated / terminated SMS concatenation • Mobile-originated SMS e-mail concatenation • Receipt notification
Application Interface	• NDIS NIC interface support (Windows XP, Windows Vista, Windows 7, Windows CE^a, Linux) • Multiple non-multiplexed USB channel support • Dial-up networking • USB selective suspend to maximize power savings • AT command interface—(non-voice) 27.007 standard, plus proprietary extended AT commands • CnS—Sierra Wireless' proprietary Control and Status host interface protocol • Software Development Kits (SDK) including APIs (Application Program Interfaces) and drivers (core, device) for Windows, Windows CE, and Linux • Optional eSIM support
Phonebook	Supports Release 99 phone book features
Packet Mode	• Dual-mode UMTS (WCDMA) / HSDPA / EDGE / GPRS operation • GPRS class B, multislot class 10 operation—Supports CS1–CS4 coding schemes • EDGE multislot class 12 operation—Supports MCS1–MCS9 coding schemes • UMTS (WCDMA) R99 data rates—384 kbps downlink, 384 kbps uplink • HSDPA ▪ Category 5/6 data rate—3.6 Mbps (peak rate) ▪ Category 12 data rate—1.8 Mbps • Circuit-switched data bearers—64 kbps (maximum) uplink and downlink

Feature	Description
Connectivity/GSM	• Multiple (up to 16) cellular packet data profiles • Traditional modem COM port support for DUN, CSD, and AT commands (concurrent with NDIS) • Suspend / Resume • Sleep mode for minimum idle power draw • SIM application toolkit with proactive SIM commands • Enhanced Operator Name String (EONS) • Automatic GPRS attach at power-up • GPRS detach • Combined GPRS / IMSI detach; MS-initiated and network-initiated detach • Mobile-originated PDP context activation/deactivation • Support QoS profile ▪ Release 99 QoS negotiation—Background, Interactive, and Streaming ▪ Release 97—Precedence Class, Reliability Class, Delay Class, Peak Throughput, Mean Throughput • Static and Dynamic IP address. The network may assign a fixed IP address or dynamically assign one using DHCP (Dynamic Host Configuration Protocol). • PAP and CHAP support • PDP context type (IPv4). IP Packet Data Protocol context • RFC1144 TCP/IP header compression • Interaction with existing GSM services (MO/MT SMS voice calls) while: • GPRS is attached, or • In a GPRS data session (class B GPRS suspend / resume procedures) • Support for EAP-SIM authentication and PC / SC. EAP-SIM is available through: ▪ The API ▪ AT commands ▪ The PC / SC interface
Voice ^b	Supports: • All GSM vocoders, Enhanced Full Rate (EFR), Full Rate (FR), and WCDMA Adaptive Multirate (AMR) encoders • MO and MT calling • Echo cancellation and noise reduction • Emergency calls (112, 110, 911, etc.) • Incoming call notification • TTY/TDD compatibility through microphone/speaker connections using the audio interface
Supplementary Services ^b	• Call Barring • Call Forwarding • Call Hold • Caller ID • Call Waiting • Multi-party service • USSD

Feature	Description
GPS ^c	Provides: - Standalone GPS functionality - gpsOneXTRA™ - A-GPS features - NMEA support <i>Note:</i> Actual GPS functionality is dependent on the firmware version, and on module configuration.
Network Selection	- Network selection procedures described in 3G 22.011, R5 (June 2005), 3G 23.122 (June 2005), and 3G 43.022, R4 - RRC connection reject message to redirect from a 3G system to a 2G system, according to 25.331, R5 (June 2004) - A CPHS Customer Service Profile-like feature [PLMN Mode bit] on a USIM/SIM that hides network selection related menus - Initial HPLMN scan at two minutes after power on - An HPLMN rescan irrespective of the serving MCC - Selective disabling of any 2G or 3G frequency band - Equivalent PLMN - Network selection generally within 30 seconds of power up - Enhanced network selection (ENS)
RF	- Quad-band GSM/GPRS/EDGE (850 MHz, 900 MHz, 1800 MHz, 1900 MHz) - Dual-band UMTS WCDMA FDD - SL8080/SL8080B/SL8080T/SL8081: 850 MHz, 1900 MHz - SL8082/SL8082T/SL8082BT/SL8083: 900 MHz, 2100 MHz - Tri-band UMTS WCDMA FDD - SL8084/SL8084T/SL8085: 800 MHz, 850 MHz, 2100 MHz - GPS (1575.42 MHz) (SL8080/SL8080T/SL8082/SL8082T/SL8084/SL8084T only)
Environmental	Operating temperature ranges - Data-only devices: - Class A (3GPP compliant): -20°C to +60°C - Class B (operational, non-3GPP compliant): -30°C to +75°C - Voice-capable devices: - Class A (3GPP compliant): -30°C to +70°C - Class B (operational, non-3GPP compliant): -40°C to +85°C
Interfaces	1.8 V digital GPIO 3 V/1.8 V SIM interface - Serial (UART1) - Audio—Analog and digital (PCM) - SIM/Embedded SIM - USB 2.0 slave
Operating System	Open AT Application Framework

- Contact Sierra Wireless for platform-specific Windows CE support details.
- Voice/Supplementary services on SL8080/SL8080B/SL8080T/SL8082/SL8082T/SL8082BT/SL8084/SL8084T
- GPS on SL8080/SL8080T/SL8082/SL8082T/SL8084/SL8084T

1.2. Support Features

The SL808x, SL808xT and SL808xBT offer enabling software for Windows Mobile 6.5, Windows CE 6.0 and Linux SDK.

1.3. Support Tools

The SL808x, SL808xT and SL808xBT are compatible with the following support tools from Sierra Wireless and authorized third parties:

- Sierra Wireless's Developer Studio and SWIlog
- QXDM from Qualcomm

Note: These tools do not operate as part of the Open AT Application Framework.

1.4. Accessories

The AirPrime SL Development Kit includes:

- 1 SL Mechanical Development Kit Board
- 1 SL8080T sample
- 1 SL8082T sample
- 1 SL8084T sample
- 1 SL6087 sample
- 1 GSM Antenna
- 1 GPS Antenna
- 1 Headset
- 1 Telephone handset
- 1 RJ9 cable
- 1 USB cable
- 1 RS232 cable
- 1 Set of board to board connectors
- 1 Power supply
- 1 USB Flash disk

1.5. Hardware Development Components

Sierra Wireless manufactures a development kit to facilitate the hardware integration process.

For more information regarding the development kit, please visit the [development kit information page](#) on [Developer Zone](#).

1.6. Ordering Information

To order, contact the Sierra Wireless Sales Desk at +1 (604) 232-1488 between 8 AM and 5 PM Pacific Time.

1.7. Environmental Issues

1.7.1. RoHS Directive Compliant

The AirPrime SL808x, SL808xT and SL808xBT module is compliant with RoHS Directive 2011/65/EU which sets limits for the use of certain restricted hazardous substances. This directive states that "from 1st July 2006, new electrical and electronic equipment put on the market does not contain lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) or polybrominated diphenyl ethers (PBDE)".

1.7.2. Disposing of the Product

This electronic product is subject to the EU Directive 2012/19/EU for Waste Electrical and Electronic Equipment (WEEE). As such, this product must not be disposed of at a municipal waste collection point. Please refer to local regulations for directions on how to dispose of this product in an environmental friendly manner.

2. Functional Specifications

2.1. Functional Architecture

The global architecture of the AirPrime SL808x, SL808xT and SL808xBT module is described in the following figure.

* GPS is only available on SL8080/80T/82/82T/84/84T

Figure 1. Functional Architecture

2.1.1. Chipsets

SL808x, SL808xT and SL808xBT modems are based on Qualcomm single chip solutions (integrated baseband processor, RF transceiver, and power management IC):

- Voice modems: SL8080/SL8080B/SL8080T/SL8082/SL8082T/SL8082BT/SL8084/SL8084T – QSC6270
- Data modems: SL8081/SL8083/SL8085 – MDM6270

2.2. User Interface

2.2.1. Extended AT Commands

Several proprietary AT commands are available for AirPrime modules to use in hardware integration design and testing.

For lists of all available commands and descriptions of their functionality for use with SL808x, refer to documents [2] AirCard/AirPrime UMTS Devices Supported AT Command Reference and [3] AirPrime MC/SL Series Extended AT Command Reference.

For list of all available commands and descriptions of their functionality for use with SL808xT and SL808xBT, refer to documents [8] AT Commands Interface Guide for Firmware 7.52 and [9] ADL User Guide for Open AT Application Framework OS 6.52

2.2.2. Operating System (Open AT Application Framework Support)

Because the AirPrime SL808xT and SL808xBT module supports the Open AT Application Framework, customers can embed their own applications with the AirPrime SL808xT and SL808xBT and turn it into a solution for their specific market need.

3. Technical Specifications

3.1. Power Supply

Power is provided to the SL808x, SL808xT and SL808xBT through power and ground pins as detailed in the following table.

Table 3. Power and Ground Specifications

Signal/Pin Name	Pins	Type	Specification	Parameter	Min	Typ	Max	Units
VCC_3V6 ^a	42, 44	V	Voltage range	VCC	3.30	3.60	4.30	V
			Ripple voltage (U_{ripp})				100	mVpp
VREF_1V8	10	V	Maximum supply current = 1 mA		1.62	1.80	1.98	V
GND	19, 20, 21, 23, 28, 30, 35, 37, 38, 39, 52	V			-	0	-	V

a. Host-provided input voltage should provide 3 A instantaneous (lasting 5 ms). See Table 70 Averaged Call Mode Data DC Power Consumption for band-specific continuous current requirements.

The host device must provide power to the AirPrime soldered-down module over pins 42 and 44 (VCC_3V6) as detailed in the following table.

Table 4. Power Supply Requirements

Requirement Type	Value
Power supply	3.6 V (nominal)
Voltage range (V_{min} – V_{max})	3.3–4.3 V
Current (instantaneous (≤ 5 ms))	3 A
Current (continuous)	See Table 70 Averaged Call Mode Data DC Power Consumption ^a for band-specific values.
Power input capacitor(s)	- Add capacitance to host power rail (≥ 100 μF) to keep module operational with V_{in} in range. - Additional capacitance may be required if the host cannot meet the module's current requirements. - Conditioning capacitor (1 μF, 0.1 μF, 10 nF and 1 nF) recommended close to the power input for decoupling.

Note: The host must provide safe and continuous power to the module; the module does NOT have protection circuits to guard against electrical overstress.

3.1.1. Burst Transmission Current Requirements

The power supply must be able to deliver high current peaks in a short time due to the burst transmission nature of GSM. During these peaks, the ripple (U_{ripp}) on the supply voltage must not exceed the level noted in Table 3 Power and Ground Specifications.

The following table describes radio burst rates in connected mode. For detailed power consumption figures, see Table 70 Averaged Call Mode Data DC Power Consumption^a for band-specific values.

Table 5. Radio Burst Rates – Connected Mode

GSM/GPRS Multislot Class	RF Power Amplifier Current	Slot Duration	Period	Rising Time
Class 10 ^a	2.0 A peak	577 μ s	4.615 ms	10 μ s
Class 12 ^b				

a. Up to 2 TX slots. Total TX duration for 2 slots = 1154 μ s.

b. Up to 4 TX slots. Total TX duration for 4 slots = 2308 μ s.

3.1.2. Power Input (VCC_3V6)

An external power supply uses the VCC_3V6 pins to:

- Supply the AirPrime SL808x, SL808xT and SL808xBT module.
- Directly supply the RF components with 3.6 V.
 - It is essential to keep the voltage ripple to a minimum at this connection to avoid any phase error or spectrum modulation degradation.
 - An inadequate power supply can significantly affect RF performance (TX power, modulation spectrum, EMC performance, spurious emission, frequency error, etc.).
- Provide reference voltage VREF_1V8 (through several internal regulators) for the baseband signals. The host should draw less than 1 mA on this rail.

When the AirPrime SL808x, SL808xT, SL808xBT module is supplied with a battery, the total impedance (battery + protections + PCB) should be such that the supply will be ≥ 3.3 V during GSM burst mode operation (drawing a maximum peak current of 2.2 A for 577 μ s (one slot) or 1154 μ s (two slots) TX).

3.1.3. Start-Up Current

During the first second following Power ON, a current peak occurs. This current peak (t_{Startup}) has a duration of about 165 ms (typical).

The following table indicates the expected peak current range.

Table 6. Start-Up Current Peak Range

Current Peak at Ambient Temperature (25°C)	VCC_3V6 _{min} (3.3V)	VCC_3V6 _{typ} (3.6V)	VCC_3V6 _{max} (4.3V)
t_{Startup}	150 mA	140 mA	15 mA

3.2. Ground Connection

The AirPrime SL808x, SL808xT and SL808xBT module shielding case is the grounding. The ground must be connected on the motherboard through a complete layer on the PCB.

The ground connection is made by soldering the LGA ground pins and rectangular ground pad to the ground plane of the application board. For more information about ground connection, see section 8.7.1.1 Ground Plane and Shielding Connection.

3.3. Decoupling of Power Supply Signals

Although the AirPrime SL808x, SL808xT and SL808xBT module has embedded decoupling capacitors on the VCC_3V6 lines, additional decoupling may be required:

- EMI/RFI issues—Parallel 33 pF capacitors close to the module.
- TDMA noise (217 Hz)—Low frequency decoupling capacitors (22–100 μ F) can be used to reduce noise.

3.4. Mechanical Specifications

This section describes mechanical specifications for the AirPrime SL808x, SL808xT and SL808xBT module. For additional mechanical and environmental specifications, refer to document [5] Sierra Wireless Reliability Specification.

Table 7. Mechanical Specifications

Specification	Details
Form factor	The SL808x, SL808xT and SL808xBT is a 74-pin LGA soldered-down module with a two-piece shielded case.
Dimensions (nominal)	Length: 30 mm Width: 25 mm Thickness: 2.40 mm (nominal) Weight: approximately 3.5 g

3.4.1. Mechanical Illustrations

Figure 2. Exploded View

Figure 4. PCB Footprint

3.5. Labeling

Figure 5. SL808x Unit Label

Figure 6. SL808xT Unit Label

Note: The displayed labels are examples only. The production label will vary by SKU.

The SL808x, SL808xT and SL808xBT label is non-removable and contains:

- Sierra Wireless logo and product name. (The figures above uses 'X' to represent the actual product name. For example, SL8080, SL8081, SL8082, etc.)
- Open AT logo (only for SL8080T, SL8082T, SL8082BT and SL8084T)
- MFG PN
- ICC number and barcode
- Carrier Name
- Customer Product Number
- Qualcomm® 3G
- A-Tick logo and text (if applicable)
- CE logo and text (if applicable)
- Serial number and barcode
- IMEI or ESN number and barcode
- FCC ID
- IC number
- CMIIT ID

Note: The SL808x, SL808xT and SL808xBT support OEM partner specific label requirements.

3.6. Embedded SIM (eSIM)

The AirPrime SL808x, SL808xT and SL808xBT module is available with an embedded SIM solution that eliminates design issues related to working with a consumer-style SIM card, including:

- Improved environmental performance—The embedded SIM operates in extreme temperatures, and has higher vibration and humidity tolerances.
- Minimized size—The embedded SIM eliminates the requirements of a SIM card holder and plastic SIM, and the module is the same size with or without the embedded SIM.
- Service provider choice—The system integrator can provision the SIM with a preferred service provider or carrier, or take advantage of Sierra Wireless' existing carrier partnerships.
- Subscription portability and security—An integrated switch allows developers to provide the flexibility of switching between the embedded SIM and an external SIM as required.
- Simplified logistics—The embedded SIM does not need to be tracked, stored, or activated (as a physical SIM card would).

3.7. Thermal Considerations

When transmitting, the AirPrime SL808x, SL808xT and SL808xBT module can generate significant amounts of heat (due to the internal power amplifier) that must be dissipated in the host device for safety and performance reasons.

The amount of thermal dissipation required depends on the following factors:

- Supply voltage—Maximum power dissipation for these modules can be up to 2.0 W at voltage supply limits.
- Usage—Typical power dissipation values depend on the location within the host, amount of data transferred, etc.

You can enhance heat dissipation by:

- Maximizing airflow over/around the module
- Locating the module away from other hot components

For the SL808x, `!PCTEMP` or `!GSTATUS` can be used to return the module's current temperature. See document [2] AirCard/AirPrime UMTS Devices Supported AT Command Reference for details.

3.8. SED (Smart Error Detection)

The AirPrime SL808x, SL808xT and SL808xBT module modules use a form of SED to track premature modem resets such as:

1. Module tracks consecutive resets within 30 seconds of power-on.
2. After six (6) consecutive resets, the module waits in boot-and-hold mode for a firmware download to resolve the power-cycle problem.

In such cases, the module automatically forces a pause in boot-and-hold mode at power-on to accept an expected firmware download to resolve the problem.

3.9. Firmware Upgrade

Firmware upgrades are downloaded to the modem over the USB or UART interfaces. Contact your Sierra Wireless account representative for assistance.

With Sierra Wireless AirVantage Management Service, users can perform FOTA (firmware over the air) updates with Firmware 7.52 or newer. Visit the [AirVantage Management Service website](#) for more details.

4. Interfaces

4.1. System Design

This chapter describes the AirPrime SL808x, SL808xT and SL808xBT module's LGA pad configuration (see section 4.1.1 Pin Configuration) and supported interfaces (Table 8 Available Interfaces and Signals).

Table 8. Available Interfaces and Signals

Name	AT Command Support	Open AT Interface
General Purpose Input / Output	✓	✓
Main Serial Interface (UART1)	✓	✓
USIM Interface	✓	✓
USB 2.0 Interface	✓	✓
RF Interface		
Analog Audio Interface	✓	✓
Digital Audio Interface (PCM)	✓	✓
JTAG Interface		
Serial Peripheral Interface (SPI) ^a		✓

a. Only available with the Open AT Application Framework.

The SL808x has two main interface areas—the host I/O perimeter I/O ports (pins) and the RF ports. These interface areas are identified in the following system block diagrams: Figure 7 (SL8080/80B/80T/81), Figure 8 (SL8082/82T/82BT/83), and Figure 9 (SL8084/84T/85).

Figure 7. SL8080/SL8080B/SL8080T/SL8081 System Block

Note: SL8080B and SL8081 do not support GPS.

Figure 8. SL8082/SL8082T/SL8082BT/SL8083 System Block

Note: SL8082BT and SL8083 do not support GPS.

Figure 9. SL8084/SL8084T/SL8085 System Block

Note: SL8085 does not support GPS.

4.1.1. Pin Configuration

The following figure illustrates the pin configuration of SL808x, SL808xT and SL808xBT modules. Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments provides details for each of the module's pins.

Figure 10. SL808x, SL808xT and SL808xBT Device Pinouts²

² The names used for pins 45/46 and 47/48 were swapped from Rev.1 to be relative to the host—the pin functionality and signal direction have not changed.

4.1.2. Pin Description

The following table describes the LGA pad pin assignments.

See section 4.2 Digital I/O Electrical Information for 1V8 voltage characteristics.

Table 9. SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments^a

Pin	Signal Name		Description	Active State	Input / Output (Direction to Module)	Voltage (V)			
	Nominal	Mux				Min	Typ	Max	Type
1	GPIO_3	INT2 ^c	General purpose I/O or External interruption	High / Low	Input High	1.17	-	2.10	Digital
					Input Low	-0.30	-	0.63	
					Output High	1.35	-	1.80	
					Output Low	0	-	0.45	
2	GPIO_2	INT1 ^c	General purpose I/O or External interruption	High / Low	Input High	1.17	-	2.10	Digital
					Input Low	-0.30	-	0.63	
					Output High	1.35	-	1.80	
					Output Low	0	-	0.45

- a. During the powered-off state, digital signal pins may not be in a high impedance state.
- b. The names used for pins 45/46 and 47/48 were swapped from Rev.1 to be relative to the host—the pin functionality and signal direction have not changed.
- c. These multiplexed pins are only available with the Open AT Application Framework.
- d. The SL808x does not support SPI. Pins 11, 12, 13 and 14 are NC (No Connect) in the SL808x.

4.2. Digital I/O Electrical Information

The AirPrime SL808x, SL808xT and SL808xBT module uses 1.8 V CMOS for digital I/O. For electrical characteristics, see Table 10 Electrical Characteristics – 1.8V Type (1V8) Digital I/O.

4.2.1. Electrical Characteristics

Table 10 Electrical Characteristics – 1.8V Type (1V8) Digital I/O describes the electrical characteristics of 1.8 V CMOS pins.

Table 10. Electrical Characteristics – 1.8V Type (1V8) Digital I/O

Parameter ^a		I/O Type	Minimum	Maximum	Condition
Input/Output Pin	V _{IL}	CMOS	-0.30 V	0.63 V	
	V _{IH}	CMOS	1.17 V	2.10 V	
	V _{OL}	CMOS	0.00 V	0.45 V	I _{OL} varies by pin definition
	V _{OH}	CMOS	1.35 V	1.80 V	I _{OH} varies by pin definition
	I _{OH}			1 to 8 mA	Maximum varied by pin definition
	I _{OL}			-1 to -8 mA	

a. 'IL'—Input Low; 'IH'—Input High; 'OL'—Output Low; 'OH'—Output High

4.2.2. Pin Types

Several tables in this chapter include pin types as part of their descriptions. Table 12 Reset State Definition describes these pin types.

Table 11. Pin Type Codes

Type	Definition
A	Analog pin
I	Input
NP	No pull
O	Digital output
PU	Digital input, internal pull up
PD	Digital input, internal pull down
V	Power or Ground pin

4.2.3. Signal Reset States

Each interface described in this chapter includes a pin descriptions table, which identifies each signal's reset state. Table 12 Reset State Definition describes these reset states.

Table 12. Reset State Definition

Parameter	Definition
0	Set to GND
1	Set to supply 1V8
Pull-down	Internal pull-down with ~60 kΩ resistor
Pull-up	Internal pull-up with ~60 kΩ resistor to supply 1V8
Z	High impedance
Undefined	Caution: <i>Undefined must not be used in an application if a specific state is required at reset. These pins may toggle during reset.</i>

4.3. General Purpose Input / Output

The AirPrime SL808x, SL808xT and SL808xBT module includes fifteen (15) general purpose I/O (GPIO) pins. Table 13 GPIO Interface Features describes the purpose and features of this interface.

Some of these GPIO pins are only available with the Open AT Application Framework. See Table 14 GPIO Pin Descriptions for details.

Table 13. GPIO Interface Features

Feature	Details
Purpose	OEM-configurable general purpose I/O (control, signaling, monitoring, etc.)
Implementation	Defaults to digital output
Power	1.8 V (use VREF_1V8 as logic reference) - Output drive current up to 8 mA.

4.3.1. Pin Descriptions

The following table describes the GPIO interface pins.

Table 14. GPIO Pin Descriptions

Pin	Signal	I/O Type	Reset State ^a	Description
1	GPIO_3	1V8	- Using EMConnect^c: Set by user - Not using EMConnect: Input, pull-down	Configurable general purpose I/O
2	GPIO_2	1V8		
3	GPIO_1	1V8		
11	GPIO_4 ^b	1V8		
12	GPIO_5 ^b	1V8		
13	GPIO_6 ^b	1V8		
14	GPIO_7 ^b	1V8		

Pin	Signal	I/O Type	Reset State ^a	Description
16	GPIO_12 ^b	1V8	- Using EMConnect^c: Set by user - Not using EMConnect: Input, pull-down	Configurable general purpose I/O
17	GPIO_13 ^b	1V8		
68	GPIO_14 ^b	1V8		
60	GPIO_15 ^b	1V8		
61	GPIO_16 ^b	1V8		
47	GPIO_17 ^b	1V8		
48	GPIO_18 ^b	1V8		
62	GPIO_19 ^b	1V8		

- a. See Table 12 Reset State Definition for state definitions.
- b. These pins are only available with the Open AT Application Framework.
- c. EMConnect is only available with the SL808x.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

4.4. Serial Peripheral Interface (SPI)

Note: This feature is only available with the Open AT Application Framework.

The AirPrime SL808xT and SL808xBT module may be connected to an external chip through the SPI bus; and with the Open AT Application Framework, these pins may also be reconfigured as GPIO pins.

The SPI bus interface includes:

- A CLK signal (SPI_CLK)
- An I/O signal (SPI_DATA_MOSI)
- An I signal (SPI_DATA_MISO)
- A CS (Chip Select) signal complying with the standard SPI bus (SPI_CS_N)

Features available on the SPI bus are:

- Master mode only operation
- SPI speed is from 102Kbit/s to 26Mbit/s
- 4-wire interface
- 1 to 16 bits data length

4.4.1. SPI Pin Descriptions

The following table describes the SPI interface pins.

Note: SPI pins are NC (no connect) on the SL808x.

Table 15. SPI Interface Signals

Pin	Signal	Multiplexed with ^a	I/O Type	Reset State ^b
11	SPI_CS_N	GPIO_4	1V8	Z
12	SPI_CLK	GPIO_5	1V8	Z
13	SPI_DATA_MOSI	GPIO_6	1V8	Z
14	SPI_DATA_MISO	GPIO_7	1V8	Z

- a. These multiplexed pins are only available with the Open AT Application Framework.
- b. See Table 12 Reset State Definition for state definitions.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

4.4.2. Electrical Characteristics

The following table describes the SPI interface's electrical characteristics.

Table 16. SPI Interface Electrical Characteristics

Signal	Description	Minimum	Typical	Maximum	Unit
CLK-cycle	SPI clock frequency	0.102		26	MHz
Data-OUT delay	Data out ready delay time			5	ns
Data-IN-setup	Data in setup time	0		3	ns
Data-OUT-hold	Data out hold time	0		3	ns

4.4.3. SPI Configuration

Table 17. SPI Bus Configuration

Operation	Maximum Speed	SPI-Mode	Duplex	3-wire Type	4-wire Type
Master	26 Mb/s	0, 1, 2, 3	Half	SPI_CLK; SPI_DATA_MOSI; SPI_CS_N	SPI_CLK; SPI_DATA_MOSI; SPI_DATA_MISO; SPI_CS_N

Refer to section 4.4.5 Application for more information on the signals used and their corresponding configurations.

4.4.4. SPI Waveforms

The figure below shows the waveforms for SPI transfers with a 4-wire configuration in master mode 0.

Figure 11. SPI Timing Diagram (Mode 0, Master, 4wires)

4.4.5. Application

For the 4-wire configuration, the input and output data lines are dissociated. SPI_DATA_MOSI is used as output only and SPI_DATA_MISO is used as input only.

Figure 12. Example of a 4-wire SPI Bus Application

One pull-up resistor, R1, is needed to set the SPI_CS_N level during the reset state. Except for R1, no other external component is needed if the electrical specifications of the customer application comply with the AirPrime SL808x, SL808xT and SL808xBT module SPI interface electrical specifications.

4.5. Main Serial Interface (UART1)

The AirPrime SL808x, SL808xT and SL808xBT module includes a serial interface (UART1) for host–module communication.

The SL808x can be configured as either 4-wire UART or 8-wire UART (using reconfigured GPIO, PCM, or SPI pins); while the SL808xT and SL808xBT only supports 4-wire UART.

The following table describes the purpose and features of this interface.

See Figure 37 4-wire Main Serial Interface (UART1) for SL808x, SL808xT or SL808xBT for an implementation of the UART1 interface.

Note: *The SL808x, SL808xT and SL808xBT may be provisioned with the ability to use the UART1 interface to communicate with peripheral devices. Contact Sierra Wireless for further information.*

Table 18. UART1 Interface Features

Feature	Details
Purpose	- Serial host–module communication - Dependent on provisioning, communication with peripheral devices. Contact Sierra Wireless for further information.
Implementation	- Four-wire/eight-wire serial interface based on TIA-232 (RS232 protocol) - An RS-232 level shifter device may be required.
Data rates supported	- High speed up to 4Mbps (115K, 230K, 460.8K, 921.6K, 3.2M, 3.68M, 4M) for SL808x - Up to 230K for SL808xT and SL808xBT
Optional functionality	Dependent on provisioning, module may be able to communicate with peripheral devices. Contact Sierra Wireless to discuss possible firmware support.

4.5.1. Available Services

Dependent on device configuration, the AirPrime SL808x, SL808xT and SL808xBT supports the following data services (logical protocols) for the transfer of data and control information over the UART1 interface:

- AT—Command processor/data service
- DM (Diagnostic Message service)
- NMEA (GPS) service
- PDP services
- HIP / CnS

4.5.2. UART1 Pin Descriptions

The following table describes the UART1 interface pins.

Note: *The names used for pins 45/46 and 47/48 were swapped from Rev.1 to be relative to the host—the pin functionality and signal direction have not changed.*

Table 19. Serial Port High-Speed UART1 Interface

Signal ^a	Pin ^b	n-wire		Multiplexed with ^c	Direction wrt Host	Description/Notes
		4	8 ^d			
UART1_TXD	45	✓	✓		Output	Transmit Data: UART1 serial data transmit line (modem input)
UART1_RXD	46	✓	✓		Input	Receive Data: UART1 serial data receive line (modem output)
UART1_CTS_N	47	✓	✓	GPIO_17	Input	Clear To Send
UART1_RTS_N	48	✓	✓	GPIO18	Output	Request To Send
For 8-wire UART, the DCD, DTR, and DSR signals are duplexed over GPIO, PCM, or SPI lines. See Table 20 Duplexed (Reconfigured) UART Interface Signal Groups and section 4.5.5 Configure the UART Interface for details.						
DTR			✓		Output	Data Terminal Ready: DTR may be used to support low power operation of 4-wire UART. See sections 4.5.5 Configure the UART Interface (for SL808x only) and 4.5.6 Configure the UART Interface (for SL808xT and SL808xBT) for details.
DCD			✓		Input	Data Carrier Detect
DSR			✓		Input	Data Set Ready
WAKE_N	61		✓		Input	Similar to standard UART RI (Ring Indicator) - Activation events selected with AT+WWKUP (Ring received, SMS received, etc.) - Continues to function regardless of UART service mapping. - For example, can be generated when SMS is received.) - Active low signal

- The names used for pins 45/46 and 47/48 were swapped from Rev.1 to be relative to the host—the pin functionality and signal direction have not changed.
- All pins are 1V8.
- These multiplexed pins are only available with the Open AT Application Framework.
- 8-wire UART is only available on SL808x variants.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

Table 20. Duplexed (Reconfigured) UART Interface Signal Groups

Signal Group	DCD	DTR	DSR
GPIO	GPIO_1 (Pin 3)	GPIO_2 (Pin 2)	GPIO_3 (Pin 1)
PCM	PCM_DIN (Pin 66)	PCM_DOUT (Pin 65)	PCM_CLK (Pin 67)
SPI	SPI_CS_N (Pin 11)	SPI_CLK (Pin 12)	SPI_DATA_MOSI (Pin 13)

4.5.3. 4-Wire Serial Interface

The signals used in this interface are listed in Table 19 Serial Port High-Speed UART1 Interface.

4.5.4. 8-Wire Serial Interface

The signals used in this interface are listed in Table 19 Serial Port High-Speed UART1 Interface and Table 20 Duplexed (Reconfigured) UART Interface Signal Groups.

The interface uses dedicated signals from the 4-wire interface, and the DCD, DTR, and DSR signals from the reconfigured GPIO, PCM, or SPI pins. The RI is provided by the WAKE_N signal.

4.5.5. Configure the UART Interface (for SL808x only)

Use **AT+WHCNR**¹ to:

- Enable/disable the UART interface
- Default to 4-wire UART²
- Configure the device for 8-wire UART by selecting an I/O signal group (GPIO/PCM/SPI) to use for DCD, DTR, and DSR²
- Enable/disable the specific signals

4.5.5.1. Low Power Operation

The modem uses **AT+WHCNR**¹ to configure low power operation in the following ways:

- 8-wire UART with DTR enabled—UART is halted when DTR is deasserted, and resumed when DTR is asserted. See section 4.5.5 Configure the UART Interface for details on enabling the DTR signal.²
- 4-wire UART with sleep flag enabled:
 - The UART remains on for 15 seconds after the device boots. If there is no activity on the UART during this period, the UART is stopped.
 - The UART will resume when there is activity on the transmit line (UART1_TXD). Note that the first character may be missed due to latency. This can be mitigated by sending a spare character (for example, AAT).
 - After no activity for approximately 4 seconds, the UART will be stopped again.
- 4-wire UART with sleep flag disabled—UART never sleeps.

¹ Refer to document [3] AirPrime MC/SL Series Extended AT Command Reference for details.

² Only available on SL808x variants.

4.5.5.2. Lock the UART Interface

On systems that do not have USB support:

- The “**HWCFLGLOCK**”¹ customization may be used to prevent **!MAPUART** from being changed. This prevents the UART interface from being inadvertently disabled.
- The UART interface should only be used for AT and PDP services.

4.5.6. Configure the UART Interface (for SL808xT and SL808xBT)

Since the SL808xT and SL808xBT only support 4-wire UART, sleep and wake-up conditions of the customer application has to be configured without using UART. Refer to section 6 Global Configuration Commands and the technical appendices of document [8] AT Commands Interface Guide for Firmware 7.52 for information about **AT+W32K** and how to configure sleep mode.

Other commands needed to configure UART are available in section 8 Serial Port Commands of document [8] AT Commands Interface Guide for Firmware 7.52.

4.6. USIM Interface

The AirPrime SL808x, SL808xT and SL808xBT module includes a 4-wire USIM interface that allows a SIM to be directly connected. The following table describes the purpose and features of this interface.

Table 21. USIM Interface Features

Feature	Details
Purpose	• Communicate with USIM socket on host device • Supports regular and embedded SIMs
Implementation	• Four-wire interface • Voltage levels comply with 3GPP standards
Power	• 1.8 V (3G) or 3.0 V (2G) operation. Compliant with GSM 11.11 recommendations concerning SIM functions. • Host must keep current draw $\leq 10\text{mA}$

4.6.1. USIM Pin Descriptions

The following table describes the USIM interface pins.

Table 22. USIM Interface Signals

Pin	Signal	I/O Type ^a	Description	Notes
6	EXT_VREG_USIM		USIM power supply	• 1.8 V (3G) or 3 V (2G). • Maximum allowed current draw = 10 mA.
7	EXT_USIM_RESET		USIM reset signal	

Pin	Signal	I/O Type ^a	Description	Notes
8	EXT_USIM_DATA		USIM data	- A shunt capacitor may be needed. (PCB provision for capacitor is recommended) - Signal rise/fall times must be < 1 μs.
9	EXT_USIM_CLK		USIM clock	- Typically 4 MHz at EXT_VREG_USIM level. - Host should minimize rise time (<50 ns) by adjusting trace capacitance and filtering needs as required

a. See Table 11 Pin Type Codes for type descriptions.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

4.6.2. Application Notes

4.6.2.1. Reference Schematic

See section 14 Signal Reference Schematics for an implementation of the SIM interface.

4.6.2.2. USIM Socket Pin Description

The following table describes the required USIM socket pins.

Table 23. USIM Socket Pin Descriptions

Pin	Signal	Description
1	VCC	EXT_VREG_USIM
2	RST	EXT_USIM_RESET
3	CLK	EXT_USIM_CLK
4	-	-
5	GND	GROUND
6	-	-
7	I/O	EXT_USIM_DATA
8	-	-

4.7. USB 2.0 Interface

The AirPrime SL808x, SL808xT and SL808xBT module features a USB 2.0 interface for data transfer, modem control, and diagnostic information.

Table 24. USB 2.0 Interface Features

Feature	Details
Standards compliance	Universal Serial Bus Specification, Rev 2.0
Performance	- Optimized for high speed (480 Mbps) Throughput rates may vary significantly based on packet size, host interface, and firmware revision. - Support for Full speed (12 Mbps) Throughput performance is on an “as-is” basis and must be characterized by the OEM.
Power supply	- VCC supply 3.3 V type compatible
Additional features	Firmware download over USB

Note: The SL808x, SL808xT and SL808xBT module does not claim any CDC classes in the descriptors and does not support functional descriptors. As a result, it is not normally compatible with native CDC-ACM drivers.

4.7.1. USB Pin Descriptions

The following table describes the USB interface pins.

Table 25. USB Interface Pins

Pin	Signal	Description	Notes
50	USB_D+	HS-USB data +	- Protected against $\pm 500\text{V}$ Human Body Model ESD. - ESD suppressor with shunt capacitance $< 1\text{ pF}$ is recommended. - Host must ensure D+ and D- traces are well matched and of differential impedance of $90\ \Omega$. All high-speed differential routing techniques should be applied. - Allocate room to accommodate a common mode choke filter ($90\ \Omega$ impedance) between the module and destination
51	USB_D-	HS-USB data -	

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

4.7.2. Electrical Characteristics

The following table describes the USB interface's electrical characteristics.

Table 26. USB Interface Electrical Characteristics

Parameter	Mode	Minimum	Maximum	Unit
USB_D+	High speed	360	440	mV
USB_D	Full speed	2.8	3.6	V

4.7.3. USB Configurations

The AirPrime SL808x, SL808xT and SL808xBT module supports the USB configurations listed in the following table. The basic service configuration is PRI-dependent, and some services can be excluded, if required.

Table 27. Supported USB Configurations

Configuration	Interfaces	Services
Composite, Direct IP	OBEX, ACM, ECM	CnS, DM, NMEA, AT, DIP data
Composite, MUX-capable	OBEX, ACM	CnS, DM, NMEA, AT, PPP data
Composite	OBEX, ACM	CnS, DM, NMEA, AT, PPP data
Non-composite, MUX-capable	OBEX, ACM	CnS, DM, NMEA, AT, PPP data

4.7.4. Reference Schematics

See section 14 Signal Reference Schematics for an implementation of the USB interface.

4.7.5. USB Host Drivers

If your system will not be using Sierra Wireless drivers, refer to document [6] AirCard/AirPrime USB Driver Developer's Guide for details on developing custom USB drivers.

4.7.5.1. Host Driver Requirements

The host driver must support:

- USB host in order to interface with the module
- CDC-ADM and OBEX interface types

The host driver may optionally support:

- Low power mode—USB suspend, resume, and remote wakeup as described in document [10] Universal Serial Bus Specification, Rev 2.0
- ECM—Ethernet Control Model for Direct IP
- MUX—Sierra Wireless' implementation of the 3GPP 27.010 MUX standard over CDC-ACM

4.8. RF Interface

The AirPrime SL808x, SL808xT and SL808xBT module's RF (radio frequency) interface uses two antenna ports for Tx/Rx and GPS. The following table describes the purpose and features of this interface.

Table 28. RF Interface Features

Feature	Details
Purpose	- Primary antenna—Rx/Tx - GPS antenna—GPS functionality
Impedance	- Nominal: 50 Ω - DC: High Impedance

4.8.1. RF Connections

To protect the antenna lines from baseband signal noise:

- Connection from each antenna port (RF) to the antenna should use a coax cable or a good microstrip/strip line.
- RF trace should be 50 Ω to avoid mismatch and load pull effects.
- RF connection must be isolated from other high voltage and noisy signals to ensure a good Rx sensitivity level.
- RF traces on the host PCB could have high attenuation, so should be kept as short as possible.

For more information, see Figure 34 RF Routing Examples.

4.8.2. RF Pin Descriptions

The following table describes the RF interface pins.

Table 29. RF Interface Pins

Pin	Signal	Description	Notes
Rx/Tx Antenna			
28	Ground		
29	ANT_PRM	Main (primary) antenna	ESD protected—See document [5] Sierra Wireless Reliability Specification.
30	Ground		
GPS Antenna			
35	Ground		
36	ANT_GPS	GPS antenna	
37	Ground		

4.8.3. RF Performance

The module's radio transceiver meets the requirements of 3GPP Release 5.

The following table describes supported GSM, WCDMA, and GPS bands, conducted Tx power, and conducted Rx sensitivity.

Table 30. Band Support, Conducted Tx Power, and Conducted Rx Sensitivity

Band	Frequencies (MHz)	SL8080/SL8080B/ SL8080T/ SL8081	SL8082/SL8082T/ SL8082BT/SL8083	SL8084/SL8084T/ SL8085	Conducted Tx Power		Conducted Rx Sensitivity			
					Avg (dBm)	Notes

GPS									
GPS	1575.42	(SL8080/SL8080T/SL8082/SL8082T/SL8084/SL8084T)							

- 2% Bit Error Rate (BER) circuit switched
- 10% Block Error Rate (BLER)
- WCDMA channel spacing is 5 MHz, but this can be adjusted to optimize performance in a particular deployment scenario.

4.8.4. GPS Specifications

Note: Actual GPS functionality depends on the firmware version and module configuration.

The module provides the following GPS features:

4.8.4.1. Standalone GPS

- Leading standalone/autonomous GPS performance
- -145 dBm cold start sensitivity
- -153 dBm hot start sensitivity
- -155 dBm tracking sensitivity
- < 45 seconds average cold start TTFF (Time To First Fix) in open air
- < 3 second average super hot TTFF in open sky
- < 10 m accuracy in open sky

Note: Optimum performance is reached when there is no active data or voice call.

4.8.4.2. gpsOneXTRA™

- Enables enhanced standalone GPS operation by downloading < 40 kB file from a server on the Internet
- Performance closer to UE-based operation than traditional standalone GPS operation
- Best if downloaded once every 1–2 days, but valid for up to 7 days with some accuracy degradation

4.8.4.3. A-GPS Features

- Leading A-GPS performance
 - Exceeds 3GPP RAN 4 AGPS performance specification
- -153 dBm cold start sensitivity
- -155 dBm tracking sensitivity
- < 5 second average cold start TTFF in open sky (UE-based)
- < 3 second average super hot TTFF in open sky
- < 2 m accuracy in open sky 1 Hz tracking with CEP-50
- UMTS Control Plane (CP)—UE-assisted and UE-based
- GSM Control Plane (CP)—UE-assisted and UE-based
- OMA SUPL 1.0 User Plane (UP)—UE-assisted and UE-based

4.8.4.4. Enhanced Navigation 2.0 Feature

- Provides leading performance in car and walking navigation modes as well as accuracy while stationary
- Airline/Game/Offline mode
- GPS capability is available while phone is offline

4.8.4.5. NMEA

Supported sentences: GGA, GSA, GSV, RMC, VTG

4.8.4.6. Software

The AirPrime SL808x and SL808xT embeds an integrated and high-sensitivity Global Navigation Satellite System (GNSS) solution and comes with GNSS software, which offers a wide range of GNSS features, best performances and resources optimization in a fully integrated solution. GNSS features can be accessed easily through various interfaces which includes AT commands for both AirPrime SL808x and SL808xT, and Open AT Application Framework APIs (through Location Library) for AirPrime SL808xT.

4.8.5. Antenna Specifications

The antenna must meet the requirements specified in the following table.

The optimum operating frequency depends on the application. A dual-band, tri-band or quad-band antenna should operate in these frequency bands and have the described characteristics.

Table 31. Main Antenna (ANT_PRI) Specification

Parameter		Min	Typ	Max	Units	Notes
Connection loss		-	-	0.5	dB	Maximum loss to antenna
VSWR		-	-	2.3:1		Maximum allowed VSWR of antenna
Radiated gain	Low bands		0	5 ^a	dBi	
	High bands			3 ^b		

a. When Tx power from modem is $\leq +33$ dBm (2W)

b. When Tx power from modem is $\leq +30$ dBm (1W)

Note: Sierra Wireless recommends a maximum VSWR of 1.5:1 for both TX and RX bands. Even so, all aspects of this specification will be fulfilled even with a maximum VSWR of 2:1.

4.8.5.1. Application Notes

The following are suggested guidelines for the two antenna ports:

- The antenna should be isolated as much as possible from analog and digital circuitry (including interface signals).
- On applications with an embedded antenna, poor shielding could dramatically affect the receiving sensitivity. Moreover, the power radiated by the antenna could affect the application (TDMA noise, for instance).

- As a general recommendation, all components or chips operated at high frequencies (microprocessors, memories, DC/DC converter) or other active RF parts should not be placed too close to the AirPrime SL808x, SL808xT and SL808xBT module. In the event that this happens, the correct power supply layout and shielding should be designed and validated.
- Components near RF connections or unshielded feed lines must be prohibited.
- RF lines must be kept as short as possible to minimize loss.
- Primary path common for Tx and Rx should be routed on the host PCB using a 240 micron wide trace with (to withstand high power up to 2W RF) 50 Ω as impedance up to the antenna connector or launch point.

Note: If the impedance of the module is mismatched, RF performance is reduced significantly.

- Should be protected for ESD using a 8 kV-rated suppressor to avoid damage during antenna assembly, etc. Capacitance should be < 0.2 pF.
- RF trace and cable connecting the pin to the antenna should be of low loss (<0.3 dB)
- Antenna connected on the ANT_PRM port should offer 2:1 or better VSWR in order to maintain Tx power within +/- 2dB from the nominal power and the VSWR could be 2.3:1 or better for the Rx band frequencies.
- Antenna connected on the ANT_GPS port should offer 3:1 or better VSWR in order to maintain radiated sensitivity.
- Antenna location may affect RF performance. Although the module is shielded to prevent interference in most applications, the placement of the antenna is still very important—if the host device is insufficiently shielded, high levels of broadband or spurious noise can degrade the module's performance.
- Antenna cables should be routed, if possible, away from noise sources (switching power supplies, LCD assemblies, etc.). If the cables are near the noise sources, the noise may be coupled into the RF cable and into the antenna.

4.8.6. Radiated Emissions

The device alone meets all regulatory emissions limits when tested into a cabled (conducted) 50 Ω system. With antenna designs with up to 2.3:1 VSWR or worse, the radiated emissions could exceed limits. These emissions must be tested with the final antenna to ensure they pass. Examples of these limits would be FCC Part 22 and Part 24, test case 12.2.1 for GSM (3GPP TS 51.010), and test case 4.2.2 for WCDMA (ETSI EN 301 511).

The system gain value affects both radiated power and regulatory (FCC, IC, CE, etc.) test results.

4.8.7. Radiated Sensitivity Measurement

A wireless device contains many sources of noise that contribute to a reduction in Rx performance.

To determine the extent of any desensitization of receiver performance due to self-generated noise in the host device, over-the-air (OTA) or radiated testing is required. This testing can be performed by Sierra Wireless or you can use your own OTA test chamber for in-house testing.

Most carriers require a certain level of receiver performance to ensure proper functioning of the device on their networks. Although AirPrime soldered-down modules have been designed to meet these carrier requirements, they are still susceptible to various performance inhibitors.

4.9. Audio Interfaces

The AirPrime SL808x, SL808xT and SL808xBT module supports two audio interfaces (analog and PCM digital) and allows dynamic run-time selection of the appropriate interface:

- Analog Audio Interface
- Digital Audio Interface (PCM)

4.10. Analog Audio Interface

The AirPrime SL808x, SL808xT and SL808xBT module analog audio interface supports one microphone input and one speaker output.

Table 32 Audio Interface Features describes the purpose and features of this interface.

Table 32. Audio Interface Features

Feature	Details
Implementation	• Supports analog audio processing • Does not provide on-board filtering (except for 0.1 μF blocking capacitors on microphone lines) • Host must provide bias and signal filters • Host should float the SPK_N, SPK_P, MIC1_P and MIC1_N lines if not used. If the customer uses single-end mode, then the audio lines should be connected as shown in Figure 15, Figure 16, or Figure 19. • ESD protection may be required on audio interface lines
Features	• Echo cancellation and noise reduction • TTY/TDD compatibility through the microphone/speaker connections (Note: TTY/TDD is not supported by the PCM interface.) • On-board FIR/IIR (Finite and Infinite Impulse Response) digital filtering (also through AT commands) • AGC (Automatic Gain Control) • AVC (Automatic Volume Control) • RVE (Received Voice Enhancement) processing block control via AT command

4.10.1. Pin Descriptions

The following table describes the analog audio interface pins.

Table 33. Analog Audio Interface Connections

Pin	Signal	Description	Notes
53	MIC1_P	Line Audio input	Differential audio input, line level. In series with 0.1 μ F DC blocking capacitor.
54	MIC1_N	Line Audio input	Differential audio input, line level. In series with 0.1 μ F DC blocking capacitor.
56	SPK_N	Main speaker	Differential audio output, line level
57	SPK_P	Main speaker	Differential audio output, line level

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

4.10.2. Microphone Features

The microphone can be connected in either differential or single-ended mode:

- Differential mode—Default method (recommended). Rejects common mode noise and TDMA noise.
- Single-ended mode—Requires good ground plane, filtering and shielding to avoid audio path disturbances. Note that the audio input signal is decreased by 6 dB compared to differential mode.

The gain of both MIC inputs are internally adjusted and can be tuned using AT commands. For more information on AT commands, refer to documents [3] AirPrime MC/SL Series Extended AT Command Reference and [8] AT Commands Interface Guide for Firmware 7.52.

4.10.2.1. MIC Microphone Input

The microphone input has the following features:

- Default mode—Differential. Can also be configured in single-ended mode.
- AirPrime SL808x, SL808xT and SL808xBT module has embedded AC coupling.
- For electrical characteristics, see the following table.

Table 34. MIC Input Electrical Characteristics

Parameter	Condition	Minimum	Typical	Maximum	Unit
Mic bias voltage ^a			1.8		V
Load impedance		25.6	32		Ω
Full-scale input voltage across (MIC1_P and MIC1_N)	0 dB gain	0.89	1	1.12	V _{rms}
	24 dB gain	56.2	61.3	70.8	
Gain error (absolute)	0 dB and 24 dB gain settings	-1	0.2	1	dB
Output referred noise	0 dB gain, input grounded, A-weighted		-88.92	-88.91	dBFS
	24 dB gain, input grounded, A-weighted		-83.92	-83.92	
Input impedance	Differential mode	16	20	24	kΩ
	Single-ended mode	8	10	12	kΩ
THD+N ratio	0 dB analog gain Input frequency=1.02 kHz Output=-1dBFS	40	90.84		dB
	24 dB analog gain Input frequency=1.02 kHz Output=-1dBFS	40	82.43		dB
Input capacitance	At each pin			5	pF
Input offset voltage		-5		5	mV

a. Host must provide 1.8 V supply to bias the MIC lines. Voltage accuracy should be ±3%.

Caution: The voltage input value for MIC cannot exceed the maximum working voltage; otherwise, clipping will appear.

4.10.2.1.1. MIC Differential Connection Example

Figure 13. Example – MIC Differential Connection with LC Filter

LC filter (L1, L2, C2, C3, C4) considerations:

- Filter is not mandatory. Audio quality may be good enough without it, depending on the design.
- Filter may be used to reduce TDMA noise (from EMI perturbation).
- If no filter is used, capacitors must be removed and the coil replaced by 0 Ω resistors resulting in an equivalent circuit as shown in the following figure.

Figure 14. Example – MIC Differential Connection without an LC Filter

Capacitor C1 is highly recommended to eliminate TDMA noise and it must be connected close to the microphone.

The following table lists the recommended components to use in creating the LC filter.

Table 35. Recommended Components for a MIC Differential Connection

Component	Value	Notes
C1	12–33 pF	Must be tuned depending on the design
C2, C3, C4	47 pF	Must be tuned depending on the design

Component	Value	Notes
L1, L2	100 nH	Must be tuned depending on the design

4.10.2.1.2. MIC Single-Ended Connection Example

Figure 15. Example – MIC Single-Ended Connection with LC Filter

Single-ended connection considerations:

- Not recommended for improving TDMA noise rejection as it is usually difficult to eliminate TDMA noise from a single-ended design.
- LC filter (L1 and C2) is recommended (but not mandatory) to eliminate TDMA noise. If no filter is used, capacitor C2 must be removed and the coil replaced by 0 Ω resistors resulting in an equivalent circuit as shown in the following figure.

Figure 16. Example – MIC Single-Ended Connection without an LC Filter

Capacitor C1 is highly recommended to eliminate TDMA noise and it must be connected close to the microphone.

The following table lists the recommended components to use in creating the LC filter.

Table 36. Recommended Components for a MIC Single-Ended Connection

Component	Value	Notes
C1	12–33 pF	Must be tuned depending on the design
C2	47 pF	Must be tuned depending on the design
L1	100 nH	Must be tuned depending on the design

4.10.3. Speaker Features

The speaker can be connected in either differential or single-ended mode:

- Differential mode—Default method (recommended). Rejects common mode noise and TDMA noise.
- Single-ended mode—Requires good ground plane, filtering, and shielding to avoid audio path disturbances. Experiences power loss (power is divided by 4 in a single-ended connection) compared to differential connection.

The gain of each speaker output channel is internally adjusted and can be tuned using AT commands. For more information on AT commands, see documents [3] AirPrime MC/SL Series Extended AT Command Reference and [8] AT Commands Interface Guide for Firmware 7.52.

Discreet components (for example, resistors and capacitors) are not needed for this interface.

The following table lists the typical values of both speaker outputs.

Table 37. Speaker Information

Parameter	Typical	Unit	Connection
Z (SPK_P, SPK_N)	4	Ω	Single-ended mode
Z (SPK_P, SPK_N)	8	Ω	Differential mode

4.10.3.1. Speakers Output Power

Because SPK can provide more power, it can be connected in differential mode. The maximal specifications given below are available with the maximum power output configuration values set by AT command, and the typical values are recommended.

Caution: *It is mandatory not to exceed the maximal speaker output power and the speaker load must be in accordance with the gain selection (gain is controlled by AT command). Exceeding beyond the specified maximal output power may damage the AirPrime SL808x, SL808xT and SL808xBT module.*

4.10.3.2. SPK Speaker Output

SPK can have either a single-ended or a differential connection.

Figure 17. SPK Equivalent Circuit

The following table describes the speaker's electrical characteristics.

Table 38. SPK (Receive) Path Characteristics

Parameter	Condition	Minimum	Typical	Maximum	Unit
DAC to SPK_P/SPK_N full-scale output	f=1.02 kHz, 0 dBFS input	1.127	1.265	1.419	Vrms
Gain error (absolute)	f=1.02 kHz, -13 dBFS input	-1		1	dB
SPK_P/SPK_N output power, 4% or less THD+N	f=1.02 kHz, 0 dBFS	39.7	50	63	mW
DAC to SPK_P/SPK_N gain error relative to gain at -13 dBFS input level	f=1.02 kHz, -60 dBFS	-1.2		1.2	dB
DAC to SPK_P/SPK_N output noise level	Input=-999 dBFS Fs ^a =8 kHz or 16 kHz; A-weighted			51	μVrms
DAC to SPK_P/SPK_N signal-to-noise ratio	Ratio of full-scale output to output noise level	86.8			dB
DAC to SPK_P/SPK_N power-supply rejection	0<f<20 kHz	65			dB
DAC + SPK_P/SPK_N Supply current	Rx DAC left enabled; Rx DAC right disabled; SPK_P/SPK_N enabled; input=-999 dBFS Fs ^a =8 kHz			7	mA
DAC + SPK_P/SPK_N Supply current	Rx DAC left enabled; Rx DAC right disabled; SPK_P/SPK_N enabled; input=-999 dBFS; Fs ^a =16 kHz			8	mA

a. Fs is the sampling frequency

If a single-ended connection is used, only one of either SPK outputs has to be chosen. The result is a maximal output power divided by 4.

4.10.3.3. Differential Connection Example

Figure 18. Example – SPK Differential Connection

The impedance of the speaker amplifier output in differential mode is $R \leq 1 \Omega \pm 10\%$.

Note that the connection between the speaker and the AirPrime SL808x, SL808xT and SL808xBT module pins must be designed to keep the serial impedance lower than 3Ω when it is connected in differential mode.

4.10.3.4. Single-Ended Connection Example

Figure 19. Example – SPK Single-Ended Connection

Take note of the following when connecting the speaker in single-ended mode:

- $6.8 \mu\text{F} < C1 < 47 \mu\text{F}$ (depending on the characteristics of the speaker and the output power)
- $C1 = C2$
- $R1 = Z_{hp}$

Again, note that using a single-ended connection includes losing power (-6dB) as compared to a differential connection.

In the case of a 32Ω speaker, a cheaper and smaller solution can be implemented where $R1 = 82 \Omega$ and $C2 = 6.8 \mu\text{F}$ (ceramic).

Also note that the connection between the speaker and the AirPrime SL808x, SL808xT and SL808xBT module pins must be designed to keep the serial impedance lower than 1.5Ω when it is connected in single-ended mode.

4.10.3.5. Recommended Characteristics

- Type: 10 mW, electro-magnetic
- Impedance: 8Ω for hands-free
- Sensitivity: 110dB SPL minimum ($0\text{dB} = 20 \mu\text{Pa}$)
- Frequency response must be compatible with GSM specifications

4.10.4. Supported Voice Features

The AirPrime SL808x, SL808xT and SL808xBT module modem supports the voice-related features listed in the following table; and Table 40 details its support for supplementary services.

Table 39. Supported Voice Features

Item	Comments
USSD (Unstructured Supplementary Services Data)	This is a GSM-specific capability that supports transmitting information over GSM network signaling channels.
Voice encryption	Both A5/1 and A5/2 voice encryption are supported.
SIM Application Tool Kit with proactive SIM commands (compliant to R96)	3GPP TS 11.14 SIM Application Toolkit commands are stored on the SIM. These commands enable the SIM card to proactively drive the GSM host device and support interactions between the network and the end user.
User-configurable audio prompts	Several audio features, such as 'Incoming Call' and 'New SMS message', can be configured using AT commands.
Multi-party calling	Up to 5 remote parties are supported on a single call, plus an additional party on hold (on a separate call).

Table 40. Supported Supplementary Services

Service	Supported By		
	CnS	GSM Service Code	AT Command
Calling Line Identification Presentation (Caller ID)	Yes	Yes	Yes
Calling Line Identification Restriction (hides your ID on outgoing calls)	Yes	Yes	Yes
Call Waiting	Yes	Yes	Yes
Call Hold	Yes	Yes	Yes
Multi-party service	Yes	Yes	Yes
Call Forwarding			
Unconditional	Yes	Yes	Yes
on Mobile Subscriber Busy	Yes	Yes	Yes
on No Reply	Yes	Yes	Yes
on Mobile Subscriber Not Reachable	Yes	Yes	Yes
Call Barring			
All outgoing calls	Yes	Yes	Yes
Outgoing international calls	Yes	Yes	Yes
Outgoing international calls (except those directed to the home PLMN country)	Yes	Yes	Yes
All incoming calls	Yes	Yes	Yes
Incoming calls when roaming outside the home PLMN country	Yes	Yes	Yes

4.11. Digital Audio Interface (PCM)

Note: This feature is only available in AirPrime SL8080/80B/80T/82/82T/82BT/84/84T.

The SL8080/80B/80T/82/82T/82BT/84/84T module's PCM audio interface features the following characteristics:

- Runs in master mode
- Supports Linear (13-bit), A-Law (8-bit), and μ -Law (8-bit) companding algorithms
- Supports 2.048 MHz short frame sync (PCM) and 128 kHz long frame sync (AUX_PCM) operation

Note: The PCM interface is not AC97-compliant.

Table 41. PCM Digital Audio Interface Connections

Pin	Signal	Type ^a	Description	Notes
64	PCM_SYNC	PD	PCM sync	8 KHz pulse that synchronizes frame data in/out.
65	PCM_DOUT	O	PCM output	Frame 'data out' relies on selected configuration mode.
66	PCM_DIN	PD	PCM input	Frame 'data in' relies on selected configuration mode.
67	PCM_CLK	O	PCM clock	2 MHz for primary PCM mode. Controls data transfer with the audio peripheral.

a. See Table 11 Pin Type Codes for type descriptions.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

4.11.1. PCM Interface (Short Frame Sync, 2.048 MHz)

The following figures and Table 42 describe the short frame sync (2.048 MHz) PCM interface.

Figure 20. Timing Diagram – Short Frame Sync (PCM_SYNC)

Figure 21. Timing Diagram – PCM_CODEC to SL808x, SL808xT and SL808xBT

Figure 22. Timing Diagram – SL808x, SL808xT and SL808xBT to External PCM_CODEC

Table 42. PCM_CODEC Short Frame Sync (2.048 MHz) Timing Parameters

Parameter	Condition	Minimum	Typical	Maximum	Unit
t(sync)	PCM_SYNC cycle time (PCM_SYNC_DIR=1)		125		μ s
t(synca)	PCM_SYNC asserted time (PCM_SYNC_DIR=1)	400	500		ns
t(syncd)	PCM_SYNC de-asserted time (PCM_SYNC_DIR=1)		124.5		μ s
t(clk)	PCM_CLK cycle time (PCM_CLK_DIR=1)		488		ns
t(clkh)	PCM_CLK high time (PCM_CLK_DIR=1)		244		ns
t(clkl)	PCM_CLK low time (PCM_CLK_DIR=1)		244		ns
t(susync)	PCM_SYNC setup time to PCM_CLK falling (PCM_SYNC_DIR = 1, PCM_CLK_DIR = 1)	60			ns
t(hsync)	PCM_SYNC hold time after PCM_CLK falling (PCM_SYNC_DIR = 1, PCM_CLK_DIR = 1)	60			ns
t(sudin)	PCM_DIN setup time to PCM_CLK falling	50			ns
t(hdin)	PCM_DIN hold time after PCM_CLK falling	10			ns
t(pdout)	Delay from PCM_CLK rising to PCM_DOUT valid			350	ns
t(zdout)	Delay from PCM_CLK falling to PCM_DOUT HIGH-Z		160		ns

4.11.2. Auxiliary PCM (Long Frame Sync, 128 kHz)

The following figures and Table 43 describe the long frame sync (128 kHz) PCM interface.

Figure 23. Timing Diagram – Long Frame Sync (AUX_PCM_SYNC)

Figure 24. Timing Diagram – AUX_PCM_CODEC to SL808x, SL808xT and SL808xBT

Figure 25. Timing Diagram – SL808x, SL808xT and SL808xBT to AUX_PCM_CODEC

Table 43. AUX_PCM_CODEC Timing Parameters

Parameter	Condition	Minimum	Typical	Maximum	Unit
t(auxsync)	AUX_PCM_SYNC cycle time		125		μs
t(auxsynca)	AUX_PCM_SYNC asserted time	62.4	62.5		μs
t(auxsyncd)	AUX_PCM_SYNC de-asserted time	62.4	62.5		μs
t(auxclk)	AUX_PCM_CLK cycle time		7.8		μs
t(auxclkh)	AUX_PCM_CLK high time	3.8	3.9		μs
t(auxclkl)	AUX_PCM_CLK low time	3.8	3.9		μs

Parameter	Condition	Minimum	Typical	Maximum	Unit
t(suauxsync)	AUX_PCM_SYNC setup time to AUX_PCM_CLK rising	1.95			μs
t(hauxsync)	AUX_PCM_SYNC hold time after AUX_PCM_CLK rising	1.95			μs
t(suauxdin)	AUX_PCM_DIN setup time to AUX_PCM_CLK falling	70			ns
t(hauxdin)	AUX_PCM_DIN hold time after AUX_PCM_CLK falling	20			ns
t(pauxdout)	Propagation delay from AUX_PCM_CLK AUX_PCM_DOUT valid			50	ns

4.12. JTAG Interface

The AirPrime SL808x, SL808xT and SL808xBT module includes a six-wire JTAG interface.

A six-wire JTAG ZIF connector may be installed to allow Sierra Wireless to use the interface for debugging/testing. (See section 13.1 JTAG Connector for recommended suppliers.)

If platform issues arise, contact Sierra Wireless for assistance.

4.13. Short Message Service (SMS)

The following table summarizes the SL808x, SL808xT and SL808xBT module's compliance with specific SMS features:

Table 44. SMS Features

Feature	Supported
Mobile-terminated SMS	✓
Mobile-originated SMS	✓
Point-to-Point messaging	✓
Cell Broadcast messaging	✗

4.14. UMTS Radio Access Bearers Supported

The SL808x, SL808xT and SL808xBT modem supports the majority of the radio access bearers specified in 3GPP TS 34.108. If you require a detailed list, contact Sierra Wireless.

>> 5. Signals and Indicators

5.1. Overview

This chapter describes signals for control and handshaking of the AirPrime SL808x, SL808xT and SL808xBT module from the host (Table 45 Available Signals), and describes how the system implements Smart Error Detection using those signals.

Table 45. Available Signals

Name	AT Command Support	Open AT Interface

a. Only available with the Open AT Application Framework.

5.2. Power ON/OFF Signal (POWER_ON_N)

The POWER_ON_N signal is an active-low input that controls the module's power state.

Table 46. POWER_ON_N Signal Features

Feature	Details
Purpose	Power modem on/off
Implementation	• Digital input with internal pull up. • 1.8 V logic • Active low • Signal driven only by open-drain output from the host.

5.2.1. Pin Descriptions

The following table describes the POWER_ON_N signal pins.

See section 4.2 Digital I/O Electrical Information for 1V8 voltage characteristics.

Table 47. ON/OFF Signal Pin Description

Pin	Signal	I/O	I/O Type	Description
43	POWER_ON_N	I	CMOS	Module power-on

5.2.2. Electrical Characteristics

Caution: All external signals must be inactive when the AirPrime SL808x, SL808xT and SL808xBT module is OFF to avoid any damage when starting and to allow the module to start and stop correctly.

Refer to Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for basic characteristics (type, voltage).

5.2.3. Signal Timing

Figure 26 and Table 48 describe the timing sequence for powering the device on and off.

Figure 26. POWER_ON_N Signal Timing

Table 48. POWER_ON_N Signal Timing Parameters

Parameter	Description	Period		
		Min	Typ	Max
t _{pu}	Power up—Time required to boot device and reach device ready state.	5 s	-	7 s
t _{pd_hold}	Power down hold—Time required to acknowledge POWER_ON_N deassertion.	500 ms	-	-
t _{pd}	Power down—Time required to power device off after POWER_ON_N is acknowledged	700 ms	10 s	Note ^a
t _{sm_clr}	Smart recovery cleared—Time between booting device and reaching smart recovery mechanism disabled state.	-	20 s	35 s
t _{rst_hi}	Reset high—Time between POWER_ON_N assertion and SYSTEM_RESET_N deassertion.	-	400 ms	-
t _{rst_lo}	Reset low—Time between initiating power-off sequence and SYSTEM_RESET_N assertion.	-	1 s	-

- a. Maximum t_{pd} is proportional to any load capacitance on the VREF_1.8V. It is recommended that powering on should be delayed until after the VREF_1.8V has fully decayed to 0 V.

For a successful power ON, the QSC62x0 expects the POWER_ON_N to be low until the PS_HOLD signal goes high. No specifications are available for the time delay between VCC_3V6 going high and POWER_ON_N going low. This is because if POWER_ON_N is pulled low before VCC_3V6 goes high, the QSC62x0 will not power ON. Instead, it will wait until the VPH_PWR node crosses the UVLO threshold and if the POWER_ON_N pin is pulled low during this time, the QSC62x0 will start the power ON sequence. If the POWER_ON_N pin stays low until PS_HOLD goes high, power ON will be successful.

Sierra Wireless recommends for customers to tie POWER_ON_N to ground permanently in applications for powering ON the card whenever there is a valid supply voltage on the device.

5.3. Reset Signal (SYSTEM_RESET_N)

The SYSTEM_RESET_N signal is a bi-directional line that initiates a modem reset or indicates the modem's reset condition.

Table 49. Reset Signal Features

Feature	Details
Purpose	Reset modem Used by host to reset the modem.
Implementation	- Digital input 1.8 V logic - Host to provide a 100 kΩ pull-up resistor - Initiates modem reset when driven externally. - Indicates modem processor reset condition when not driven externally. - Internally driven. Logic high state may be overridden by pulling it low via an open drain sink that is capable of ≥ 10 mA. Note: <i>This pin is also required for JTAG programming.</i>

Caution: *Holding SYSTEM_RESET_N low for long periods of time could result in the module being held in a high power consumption state. Current draw varies depending on hardware state at time of signal assertion; > 50 mA is not uncommon.*

5.3.1. Pin Descriptions

The following table describes the SYSTEM_RESET_N signal pin.

Table 50. Reset Signal Pin Description

Pin	Signal	I/O	I/O Type	Description
63	SYSTEM_RESET_N	I	Digital	Module reset

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

5.3.2. Electrical Characteristics

The following table describes the reset signal's electrical characteristics.

Refer to Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for basic characteristics (type, voltage).

Table 51. Reset Signal Electrical Characteristics

Parameter	Minimum	Typical	Maximum	Unit
V_H^a	0.57			V
V_{IL}	0		0.57	V
V_{IH}	1.33			V

a. V_H : Hysteresis voltage

5.3.3. Signal Timing

Figure 27 and Table 52 describe the timing sequence for resetting the device.

Figure 27. *SYSTEM_RESET_N* Signal Timing

Table 52. *SYSTEM_RESET_N* Signal Timing Parameters

Parameter	Description	Period		
		Min	Typ	Max
t_{pu}	Power up—Time required to boot device and reach device ready state.	5 s	-	7 s
t_{rst_hi}	Reset high—Time between <i>POWER_ON_N</i> assertion and <i>SYSTEM_RESET_N</i> deassertion.	-	400 ms	-
t_{rst_asst}	Reset assert—Time required to initiate a reset by holding <i>SYSTEM_RESET_N</i> low externally.	40 ms	100 ms	-

Note: *An operating system reset is preferred to a hardware reset.*

5.3.4. General Notes

- This reset line should not be driven unless the host needs to enforce a baseband reset by asserting a logic low.
- An open collector or open drain transistor can be used. If an open collector is chosen, T1 can be a ROHM DTC144EE.

Table 53. Reset Settings

Reset Command	SYSTEM_RESET_N (Pin 63)	Operating Mode
1	0	Reset activated
0	1	Reset inactive

5.4. Wake Signal (WAKE_N)

This signal is used by the AirPrime SL808x, SL808xT and SL808xBT module to wake the host when a predetermined condition is satisfied (such as when a call is received).

Table 54. Wake Signal Features

Feature	Details
Purpose	Wake Host interface • Wake host when a predetermined condition is satisfied (for example, when a call is received).
Implementation	• Low = On • Active low, 1.8 V logic. • During the powered-off state, this pin may not be in a high impedance state. The host side must implement appropriate measures to accommodate this.

5.4.1. Pin Descriptions

The following table describes the wake signal pin.

Table 55. Wake Signal Pin Description

Pin	Signal	Multiplexed with ^a	I/O	I/O Type	Description
61	WAKE_N	GPIO_16	O	Digital	Wake Host interface

a. This multiplexed pin is only available with the Open AT Application Framework.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

5.4.2. Electrical Characteristics

Refer to Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for basic characteristics (type, voltage).

5.5. Disable Signal (W_DISABLE_N)

This signal is used by the host to disable (or enable) the AirPrime SL808x, SL808xT and SL808xBT module's RF connection.

Table 56. Wireless Disable Signal Features

Feature	Details
Purpose	Wireless disable Used by host to disable or enable low power mode ('airplane mode').
Implementation	- Low = Put module in airplane mode - Digital input. - Active low 1.8 V logic - Host to provide a pull-up resistor of 50-100 kΩ.

5.5.1. Pin Descriptions

The following table describes the wireless disable signal pin.

Table 57. Wireless Disable Signal Pin Description

Pin	Signal	Multiplexed with ^a	I/O	I/O Type	Description
62	W_DISABLE_N	GPIO_19	I	Digital	Wireless disable

a. This multiplexed pin is only available with the Open AT Application Framework.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

5.5.2. Electrical Characteristics

Refer to Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for basic characteristics (type, voltage).

5.5.3. Signal Timing

Figure 28 and Table 58 describe the timing sequence for entering/exiting low power mode ('airplane mode').

Figure 28. W_DISABLE_N Signal Timing

Table 58. W_DISABLE_N Signal Timing Parameters

Parameter	Description	Period		
		Min	Typ	Max
t_WDIS_db	W_DISABLE_N Debounce—Time between changing W_DISABLE_N logic level and RF mode changing.	5 s	-	7 s

5.6. Buzzer Output (BUZZER_N)

This signal is used in the implementation of a buzzer circuit.

Table 59. Buzzer Signal Features

Feature	Details
Purpose	Enable off-board buzzer
Implementation	Binary I/O used by host as a buzzer enable line

5.6.1. Pin Descriptions

The following table describes the wireless disable signal pin.

Table 60. Buzzer Output Pin Description

Pin	Signal	Multiplexed with ^a	I/O	I/O Type	Reset State
68	BUZZER_EN	GPIO_14	O	Digital	Z

a. This multiplexed pin is only available with the Open AT Application Framework.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

5.6.2. Electrical Characteristics

Refer to Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for basic characteristics (type, voltage).

5.7. Flash LED (LED_FLASH)

This digital output may be used to drive a general purpose LED.

Table 61. LED Signal Features

Feature	Details
Purpose	- Flash LED output - Used by host to control LED status by controlling LED diode bias.
Implementation	- Digital output. 1.8 V logic - Source/sink maximum—8 mA - LED behavior can be configured by adjusting software settings. - LED pattern can be used to indicate network connection status. - Blink rate up to 10 Hz supported

5.7.1. Pin Descriptions

The following table describes the LED signal pin.

Table 62. LED_FLASH Pin Description

Pin	Signal	Multiplexed with ^a	I/O	I/O Type	Reset State	Description
60	LED_FLASH	GPIO_15	O	Digital	1 and Undefined	LED driving

a. This multiplexed pin is only available with the Open AT Application Framework.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

5.7.2. Electrical Characteristics

The following table describes the LED_FLASH signal's electrical characteristics.

Refer to Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for basic characteristics (type, voltage).

Table 63. LED_FLASH Signal Electrical Characteristics

Parameter	Condition	Minimum	Typical	Maximum	Unit
V _{OL}		0		0.45	V
V _{OH}		1.35		1.80	V

Parameter	Condition	Minimum	Typical	Maximum	Unit
I _{OUT}				8	mA

5.7.3. LED Status

The following table describes the status of the embedded module based on the status of the flash LED.

Table 64. LED_FLASH Status

LED_FLASH Status	Embedded Module Status
Permanently ON	The embedded module is switched ON, but not registered on the network.
Slow flash – LED is ON for 200ms, then OFF for 2s	The embedded module is switched ON and registered on the network.
Quick flash – LED is ON for 200ms, then OFF for 600ms	The embedded module is switched ON and, registered on the network and communication is in progress.

For more information about enabling or disabling the flash LED, refer to documents [2] AirCard/AirPrime UMTS Devices Supported AT Command Reference and [8] AT Commands Interface Guide for Firmware 7.52.

5.8. External Interrupt

Note: This feature is only available with the Open AT Application Framework.

The AirPrime SL808xT and SL808xBT module provides three external interrupt inputs, which can be activated on the:

- High to low level transition
- Low to high level transition
- Low to high and high to low level transitions

When used, the interrupt inputs must not be left open; and when they are not used, they must be configured as GPIOs.

5.8.1. Pin Description

The following table describes the external interrupt pins.

Table 65. External Interrupt Pin Descriptions

Pin	Signal	I/O Type	Multiplexed with	Reset State ^a	Description
1	INT2	1V8	GPIO_3	Z	External interrupt
2	INT1	1V8	GPIO_2	Z	External interrupt
3	INT0	1V8	GPIO_1	Z	External interrupt

a. See Table 12 Reset State Definition for state definitions.

See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for additional pin-specific details.

5.8.2. Electrical Characteristics

Refer to Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for basic characteristics (type, voltage).

5.8.3. Application Notes

The external interrupt pins are high impedance input types so it is important to set the interrupt input signals with pull-up or pull-down resistors if they are driven by an open drain, an open collector or by a switch. If the interrupt signals are driven by a push-pull transistor, then no pull-up or pull-down resistors are necessary.

Figure 29. Example of INT0 Driven by an Open Collector

Where:

- The value of R1 can be 47k Ω
- T1 can be a ROHM DTC144EE open collector transistor

5.9. Power Rail (VREF_1V8)

The AirPrime SL808x, SL808xT and SL808xBT module includes a rail that the host uses to provide a 1.8 V logic reference (maximum limit) for the pins listed in Table 67 1.8 V Connector Pins.

5.9.1. Pin Descriptions

The following table describes the VREF_1V8 output pin.

See section 4.2 Digital I/O Electrical Information for 1V8 voltage characteristics and reset state definitions.

Table 66. VREF_1V8 Pin Descriptions

Pin	Signal	I/O	I/O Type	Description
10	VREF_1V8	O	Supply	1.8 V digital supply

Table 67. 1.8 V Connector Pins

Pin	Signal Name	Description
1	GPIO_3	General Purpose I/O
2	GPIO_2	General Purpose I/O
3	GPIO_1	General Purpose I/O
6	EXT_VREG_USIM ^a	USIM VCC supply
7	EXT_USIM_RESET ^a	USIM reset
8	EXT_USIM_DATA ^a	USIM I/O pin
9	EXT_USIM_CLK ^a	USIM clock
11	SPI_CS_N	SPI chip select
12	SPI_CLK	SPI clock
13	SPI_DATA_MOSI	SPI data (Master Output / Slave Input)
14	SPI_DATA_MISO	SPI data (Master Input / Slave Output)
45	UART1_TXD	UART Transmit Data
46	UART1_RXD	UART Receive Data
47	UART1_CTS_N	UART Clear To Send
48	UART1_RTS_N	UART Request To Send
60	LED_FLASH	LED driver
61	WAKE_N	Wake Host Interface
62	W_DISABLE_N	Wireless disable
63	SYSTEM_RESET_N	Reset
64	PCM_SYNC	PCM sync
65	PCM_DOUT	PCM data output
66	PCM_DIN	PCM data input
67	PCM_CLK	PCM clock

a. USIM interface may be configured as 1.8 V or 3.0V.

Each digital output has a maximum current of 8 mA.

5.9.2. Electrical Characteristics

The following table describes the power rail signal's electrical characteristics.

Table 68. VREF_1V8 Signal Electrical Characteristics

Parameter		Minimum	Typical	Maximum	Unit
VREF_1V8	Output voltage	1.65	1.8	1.95	V
	Output current			1	mA

5.9.3. VREF_1V8 – 1.8 V Logic Reference

Note: VREF_1V8 is only available when the AirPrime SL808x, SL808xT and SL808xBT module is ON.

The following are good design practices to consider:

- Total current draw must be < 1 mA.
- If used as a reference only (host provides its own pull-up voltage rail), a 100 Ω resistor should be put in series.
- Depending on the host PCB trace length for this signal, PCB provision for decoupling capacitors may be required.

5.10. Reserved

The AirPrime SL808x, SL808xT and SL808xBT module includes pins that may not be used in your host design. These pins should be handled in the following ways:

- Pins marked 'Reserved - DNC'—Leave these pins unconnected. (See Table 9 SL808x, SL808xT and SL808xBT LGA Pad Pin Assignments for pin assignments/names.)
- Unused inputs/outputs on specific interfaces (USB, USIM, etc.)—Leave as no-connects.

6. Power Consumption

The power consumption numbers listed in this section are for the AirPrime SL808x, SL808xT and SL808xBT module connected to the host PC via USB. The module does not have its own power source and depends on the host device for power. Typical values are measured at room temperature, and minimum and maximum values are measured over the entire operating temperature range. For a description of input voltage requirements, see section 3.1 Power Supply.

Table 69. Averaged Standby DC Power Consumption

Signal	Description	Bands	Typ	Peak	Units	Notes/Configuration
VCC	Standby current consumption with Sleep mode activated (assumes USB bus is fully suspended during measurements)					
	HSDPA / WCDMA	UMTS bands	3.8	140	mA	DRX cycle = 8 (2.56 s)
	GSM / GPRS / EDGE	GSM bands	2.4	145		MFRM = 5 (1.175 s)
	Standby current consumption with Sleep mode deactivated (assumes USB bus is fully suspended during measurements)					
	HSDPA / WCDMA	UMTS bands	65	160	mA	- DRX cycle = 8 (2.56 s) - Module power up and idle (Assumes sleep mode is never entered)
	GSM / GPRS / EDGE	GSM bands	65	165	mA	- MFRM = 5 (1.175 s) - Module power up and idle (Assumes sleep mode is never entered)
	Low Power Mode (LPM) / Offline Mode					
	RF disabled, but module is operational		2	5	mA	- State is entered when Watcher shuts down / turns off the radio. - LPM is the lowest possible ('rock bottom') state in Sleep mode.

Table 70. Averaged Call Mode Data DC Power Consumption^a

Mode	Band	Tx Power	Current (at 3.6V)		Conditions
			Peak (mA) ^b	Average (mA)	
WCDMA ^c	Band 1	+23	550	500	
		0	190	190	
	Band 8	+23	550	500	
		0	180	180	
HSDPA ^c	Band 1	+23	570	520	
		0	210	210	
	Band 8	+23	570	520	
		0	200	200	

Mode	Band	Tx Power	Current (at 3.6V)					Conditions
			Peak (mA) ^b	Average (mA)				
GSM / GPRS ^d				1 slot	2 slots	3 slots	4 slots	- Class 10 50Ω
	850	+32	1320	220	360	-	-	
	900	+32	1610	260	425	-	-	
	1800	+30	1000	180	285	-	-	
	1900	+30	860	165	260	-	-	
EDGE	850	+27	860	170	260	340	400	- Class 12 50Ω
	900	+27	960	180	280	360	430	
	1800	+26	740	150	230	290	340	
	1900	+26	660	150	220	270	300	

- a. Includes USB bus current.
- b. Peak consumption averaged over 100 μs.
- c. Current consumption increases by 50 mA with a 6 dB return loss-based load-pull.
- d. GSM mode peak current increases to 2.2A (from nominal 1.6–1.7A) with 6 dB return loss-based load-pull.

Table 71. Miscellaneous DC Power Consumption

Signal	Description	Band	Typ	Units	Notes/Configuration
VCC	Module OFF leakage current	All bands	35	μA	Full operating temperature range
	USB transmit current	All bands	10	mA	Full speed USB connection, C_L = 50 pF on D+ and D- signals

Table 72. GPS Power Consumption

Description	Value
Extra power consumption in acquisition	63.2 mA @3.6V
Extra power consumption in tracking	62.5 mA @3.6V

Table 73. Supported GPRS / EDGE Power Classes

Feature	Notes
EGSM 900/GSM 850 Power Class 4	2 W 33 dBm
GSM 1800/1900 Power Class 1	1 W 30 dBm
EDGE Power Class for 850/900 MHz	Class E2 ^a ; 27 dBm, 0.5 W
EDGE Power Class for 800/1900 MHz	Class E2 ^a ; 26 dBm, 0.4 W

- a. E2 power class applies to 8PSK modulation.

6.1. Power States

The SL808x, SL808xT and SL808xBT module has five power states as detailed in the following table.

Table 74. Supported SL808x, SL808xT and SL808xBT Power States

State	Description	Host Powered	Modem Running	USB Interface Active	RF Enabled
Normal	- Capable of placing/receiving calls or establishing data connections on network - USB interface is fully active - Current consumption in a call or data connection is affected by: - Radio band in use - Tx power - Receive gain settings - Data rate - Number of active Tx time slots - Module defaults to Normal state when VCC is first applied, if POWER_ON_N is held low.	✓	✓	✓	✓
Airplane Mode (RF off)	'Airplane' mode—Rx/Tx are disabled; USB interface is active - State entered automatically when critical voltage/temperature thresholds are exceeded. Host should consider powering off module to prevent damage to unit.	✓	✓	✓	✗
Sleep (Idle Mode)	- Normal module state between RF activity - Module cycles between wake (polling the network) and sleep, at network provider-determined interval.	✓	✓	✗	✗
Off	- Host power is connected - Module is powered down (drawing minimal current from host power supply)	N/A	✗	✗	✗
Disconnected	- Host power is disconnected from module - All module-related voltages are at 0 V.	✗	✗	✗	✗

6.1.1. Power State Transitions

The module monitors supply voltage and operating temperature and notifies the host when critical threshold limits are exceeded. (See Table 75 for details.)

Power state transitions may occur:

- Automatically, when critical supply voltage or module temperature trigger levels are encountered. See Figure 30 for details.
- Under host control, using available AT or CnS commands in response to user choices (for example, opting to switch to airplane mode) or operating conditions.

Table 75. Power State Transitions (including voltage / temperature trigger levels)

Transition	Voltage		Temperature		Notes
	Trigger	V	Trigger	°C	
Normal to Low Power	VOLT_HI_CRIT	4.35	TEMP_LO_CRIT	-25	- RF suspended - CNS_RADIO_POWER notification issued^a
	VOLT_LO_CRIT	3.00	TEMP_HI_CRIT	108	
Low Power to Normal	VOLT_HI_NORM	3.90	TEMP_NORM_LO	-15	- RF resumed - CNS_RADIO_POWER notification issued^a
Low Power to Normal or Remain in Normal (remove warnings)	VOLT_LO_NORM	3.60	TEMP_HI_NORM	85	
Normal (issue warning)	VOLT_LO_WARN	3.40	TEMP_HI_WARN	95	
Power off/on (host-initiated)	-	-	-	-	Power off recommended when supply voltage or module operating temperature is critically low or high.

a. Notification issued only if previously enabled. See document [4] AirPrime UMTS MiniCard CnS Reference for details.

Figure 30. Automatic ('Triggered') Power State Transitions

7. Network Technology Specifications

7.1. UMTS WCDMA FDD Specifications

The SL808x, SL808xT and SL808xBT supports the common WCDMA FDD specifications listed in the following table.

Table 76. Supported WCDMA FDD Specifications

Item
Physical layer specifications
DL Channels: BCH, PCH, FACH, DCH, AICH, CPICH
UL Channels: RACH, DCH
Measurement for PCCPCH RSCP RSCP/SIR
BTFD
CCTrCH as defined by examples in 25.944
Multifinger support
Cell reselection
Soft handover
Power control
PICH / DRX
Measurement for SFN / CFN timing, SFN / SFN timing
Cell selection
RLC specifications
TM / UM / AM
Max AM entities (4) • 3 for signaling • 1 for user data
Only timer based polling for AM
No timer based SDU discard for TM / UM / AM
Poll PU polling for AM
Poll prohibit
Polling options: Last ReTX PU Poll, Poll Window, Poll SDU
Status report transfer: Timer Status, Status Prohibit, Missing PU indicator
Reset procedure: Indication to RRC
Suspend / Resume
Timer based SDU discard (UM / AM / TM)
Status report transfer: Piggybacked Status PDUs, EPC based transfer
SUFIs: Sending BITMAP and RLIST
Start / stop for all three modes
RRC Specifications
Cell selection
RRC connection establishment
RRC connection release

Item
System information processing
Idle mode paging
Dedicated mode paging
Initial direct transfer
Uplink direct transfer
Downlink direct transfer
Signaling connection release
Signaling connection release request
Radio bearer establishment
Radio bearer release
Cell update
UE capability enquiry
Transmission of UE capability
Cell reselection
Measurement control
Measurement reporting
Soft HO/Active Set update
DRX mode
NV support for RRC channel scan
Radio bearer reconfiguration
Transport channel reconfiguration
Physical channel reconfiguration
UTRAN mobility information
Integrity protection
Security mode control
Encryption: UEA1
Integrity algorithm: U1A11

7.2. Supported Specifications

The SL808x, SL808xT and SL808xBT supports the specifications listed in Table 77 Supported GSM / GPRS Specifications, as well as Enhanced Network Selection (ENS), and Enhanced Operator Name String (EONS).

EONS allows the operator to define the operator name displayed for any registered network based on the MCC, MNC, and LAI on which the MS is currently registered. Strings that can be displayed when a MS is registered on a network are:

- Enhanced Operator Name String (EONS) from SIM
- Operator Name String (ONS) from SIM
- Service Provider Name (SPN) from SIM
- Network Identity and Time Zone (NITZ) as broadcast by network
- String from internal lookup table in UE

Table 77. Supported GSM / GPRS Specifications

Item	Comments
8PSK modulation	Octagonal Phase Shift Keying Coding schemes MCS1-4 are GMSK and MCS5-9 are 8PSK.
GPRS header compression	Data packet header compression supported
3GPP compliance	Protocol stack supports the requirements of: - GPRS/EDGE: 3GPP Release 99 and GERAN Feature Package #1 - WCDMA: Release 5
GPRS operation mode class B	Class B terminals support either circuit-switched or packet switched traffic (with simultaneous network attachment) but do not support both kinds of traffic simultaneously.
Link Adaptation (LA)	Together with IR (next table entry), LA adapts the EGPRS transmission to meet changing radio link conditions.
EGPRS Incremental Redundancy (IR)	IR adjusts the physical layer code rate to actual channel conditions by incrementally transmitting redundant information until decoding is successful. Automatic Repeat Request (ARQ) protocol takes care of requesting and retransmitting incorrectly received blocks. ARQ enables both dynamic RLC window management (to avoid window stalling) and dynamic RLC polling frequency (to minimize retransmission delay and save radio bandwidth).
GPRS multislot class 10	Multislot class 10 and 12 allow for dynamic allocation of time slots.
EGPRS multislot class 12	
NC0	NC0 is the normal mode of control for a GPRS mobile in which the MS (Mobile Station) performs autonomous cell reselection.
DPC	Downlink Power Control Allows the network to adjust the downlink power of any dedicated channels on the BTS based on measurement reports sent by the mobile. This allows the network to reduce interference between multiple mobiles while still maintaining adequate signal quality for the individual mobiles.
One-phase packet access for GPRS	In establishing a TBF (Temporary Block Flow) connection, the MS (Mobile Station) requests either one-phase or two-phase packet access. In one-phase access, the network responds to a packet channel request by sending a packet uplink assignment message and reserving resources for uplink transfer of a number of radio blocks. In two-phase access, a packet resource request is sent on receipt of the packet uplink assignment.
One-phase packet access for EGPRS	
Two-phase packet access for GPRS	
Two-phase packet access for EGPRS	
RLC-acknowledged operation mode	The RLC-acknowledged and LLC-acknowledged modes are used to ensure the integrity of received data where QoS requires it. RLC (Radio Link Control) acknowledgment is typically the default (depending on the network and user profile). LLC-acknowledgment is optional and ensures that all LLC (Logical Link Control) frames are received without error. Since LLC-acknowledged mode requires acknowledgement of all LLC frames, the mode has an impact on throughput.
RLC-unacknowledged operation mode	
LLC-acknowledged transmission mode	
LLC-unacknowledged transmission mode	
GSM network operation mode I and II	The Network Operating Mode specifies the coordination of paging for circuit-switched and packet-switched services. Mode I - The mobile can receive circuit-switched pages while in a packet-switched call. Mode II - The mobile cannot receive a circuit-switched page while in a packet-switched call, as it would force the mobile to constantly monitor its CCCH channel.

Item	Comments
(SL8080/80B/82/84) PBCCH / PCCCHI	Packet Broadcast Control Channel PBCCH is a packet data signaling channel that can supplement the BCCH GSM control channel, allowing decoupling of voice and packet control channels to set up data calls. PBCCH broadcasts GPRS / EGPRS specific cell re-selection parameters for serving and neighbor cells used in cell selection / re-selection for packet services.
GPRS test modes (ETSI test mode A and B)	The European Telecommunications Standards Institute (ETSI) defines standards and requirements for testing of GSM mobile equipment. In test mode A, the mobile requests an uplink TBF and transmits random data on a designated number of timeslots. This causes a device to transmit data without using upper layer protocols. Once the transmission has started, the downlink TBF halts. The device remains in this mode until the testing equipment terminates it. In test mode B, the mobile is prompted to receive data on a number of specified downlink timeslots and re-transmit the same data back on the corresponding uplink timeslots. Test mode B allows tests to be performed on both the transmitter and receiver within a single session.
NACC (R4 GERAN Feature Set 1)	Network Assisted Cell Change Enables the network to provide additional information about neighbor cells to the mobile while in a packet data session, which decreases the experienced service delays caused by cell re-selection.
MAIO	Mobile Allocation Index Offset MAIO and Hopping Sequence Number (HSN) are used in conjunction with Frequency Hopping to determine the hopping sequence used in each frame. The MAIO supports as many values as there are frequencies in the hopping list, and these are used to indicate the offset within the hopping list that identifies the frequency used.
Packet enhanced measurement report (PEMR)	Packet Enhanced Measurement Report (PEMR) is one of the RLC / MAC (Radio Link Control and Medium Access Control) control messages that include a carrier identifier. This message is a requirement of supporting multicarrier TBF.
Delayed TBF Release	Delayed Temporary Block Flow Release (also called Extended Uplink TBF) Delayed TBF Release reduces latency between uplink data transfers and reduced signaling on the network by maintaining a connection for brief periods when the network is temporarily inactive and the mobile station has no radio link control information to send. For this feature to work properly, the mobile station must support delayed TBF release.
Extended Dynamic Allocation	Radio blocks can be transmitted on up to four different PDCHs. Permits full class 12 operation.
Single Antenna Interference Cancellation (SAIC)	SAIC mitigates code-channel interference from neighboring cells resulting in fewer dropped calls, and faster download rates for e-mail and websites.
Circuit-switched data bearers ^a	These circuit-switched data bearers are supported on 2G networks: - Asynchronous 9,600 bps - Asynchronous 14,400 bps

Item	Comments
Security	
Encryption support	GPRS / EGPRS support GEA1, GEA2, and GEA3 data ciphering. GSM CSD and SMS use A5/1 and A5/3 encryption.
PAP for RADIUS authentication - GPRS / EGPRS	PAP (Password Authentication Protocol) is a method of authenticating usernames and passwords against a database on a RADIUS (Remote Authentication Dial-In User Service) server. In a standard login, the service provider prompts for a username and password. In PAP authentication, the username and password are entered in the client's dialing software and sent as one data package, rather than the server sending a login prompt and waiting for a response.
CHAP for RADIUS authentication - GPRS / EGPRS	CHAP (Challenge Handshake Authentication Protocol) is a more secure method for connecting to a system than PAP. After a link is established, the server sends a challenge message to the client. The client responds with a value calculated using a one-way hash function. The server compares its own calculation of the expected hash value to the client's response. If the values match, the authentication is acknowledged; otherwise the connection is terminated.
Support for encryption algorithm UEA1 (Kasumi)	UEA1 (UMTS Encryption Algorithm) generates the keystream as a function of a cipher key that is re-synchronized to every MAC / RLC frame. UEA is based on the Kasumi algorithm.
Support for integrity algorithm UIA1 (Kasumi)	UIA1 (UMTS Integrity Algorithm) is the algorithm used to compute the IK (Integrity Key) used in message authentication. UIA is based on the Kasumi algorithm.
UMTS	
WCDMA-to-GPRS reselection in CELL_FACH	CELL_FACH is an RRC (Radio Resource Control) service state in which cell reselection is performed. This feature prevents dropping of RRC connections.
Inter-frequency reselection in Cell_FACH	
Radio link failure	Radio link failure is a procedure that indicates an 'out-of-synch' state on one or more radio links. Node B of the RNC (Radio Network Controller) reports this event before attempting resynchronization. The radio link restoration procedure indicates restoration of the 'synchronized' state.
SIB scheduling	SIB (System Information Block) scheduling controls the broadcasting of information to user equipment in a cell. The user equipment retrieves the schedule, and is then able to change to sleep mode, receiving only those blocks that it needs.
SIB modification	
Re-establishment procedure	Following a radio link failure, the RNC maintains the RRC connection, waiting for re-establishment.
VT + PS call (subject to network availability)	Simultaneous VT (Video Terminal) and PS (Packet Switched) calls are supported.
Packet Cell Change Order from GSM→UTRAN	Call transfer between GSM-based and UTRAN-based cells is supported.
Background PLMN search	Improved algorithm for Higher Priority PLMN (HPPLMN) search while camped on a 3G cell.
Configurable Release 5 or Release 99 support	

Item	Comments
Circuit-switched data bearers	
Data bearers ^a	These circuit-switched data bearers are supported on 3G networks: • Synchronous transparent mode = 64000 bps • Synchronous transparent mode = 56000 bps • Asynchronous V110 UDI = 14400 bps • Asynchronous V110 UDI = 28800 bps • Asynchronous V110 UDI = 38400 bps • Asynchronous V120 = 14400 bps • Asynchronous V120 = 28800 bps • Asynchronous V120 = 56000 bps
HSDPA	
Data rates	The following data rates are supported: • Category 12 (1.8 Mbps) • Category 5/6 (3.6 Mbps)
HSDPA logical channels	These HSDPA logical channels are supported: • HS-SCCH • HS-DPCCH • HS-PDSCH—Up to ten HS-PDSCH channels are supported.
HSDPA transport channels	HS-DSCH is supported at these rates: • 120 kbps • 240 kbps • 360 kbps
Incremental redundancy	IR adjusts the physical layer code rate to actual channel conditions by incrementally transmitting redundant information until decoding is successful. Automatic Repeat Request (ARQ) protocol takes care of requesting and retransmitting incorrectly received blocks. ARQ enables both dynamic RLC window management (to avoid window stalling) and dynamic RLC polling frequency (to minimize retransmission delay and save radio bandwidth).
Chase combining retransmission scheme	The Chase combining retransmission scheme is the simplest HARQ (Hybrid Automatic Request) link adaptation technique. HARQ techniques are used to enhance system performance.
HSDPA Compressed Mode	Allows the user equipment to interrupt transmission and reception during a call for brief periods in order to measure the signal strength of neighboring cells that use different frequencies.
(SL8080/80B/82/84) Concurrent voice and HSDPA data	
HSDPA Indicator	Allows user interface to display an indicator when HSDPA data transfer is in progress.
Receiver equalizer support	
Miscellaneous	
Fast link adaptation	The data rate is adapted to radio conditions.
Vary the effective code rate	The effective code rate is varied based on code space resources.
HARQ, MAC-HS disassembly	MAC-HS (High Speed MAC) is the base station MAC (Medium Access Control) protocol. MAC-HS enables fast radio resource allocation.
MAC-HS reordering queue distribution and processing support	

Item	Comments
Cell change	These cell change methods are supported: • Synchronous and non-synchronous • Intra-Node B (softer repointing) • Inter-Node B (soft repointing)
Up-switching and down-switching of PS RAB between HS-PDSCH and DPCH	RAB (Radio Access Bearer) and channel mappings between the HS-PDSCH (High Speed Physical Downlink Shared Channel) and DPCH (Dedicated Physical Channel) are reallocated according to volume thresholds and inactivity timers.
Ciphering on the HS channel	Ciphering on high-speed channels protects radio-transmitted data against unauthorized third parties.
Support to not resume the HS channel if inter-RAT handover fails, but save the RB mapping information	RB (Radio Bearer) mapping information is preserved if a high speed channel is dropped due to the failure of an inter-RAT (Radio Access Technology) transfer.
Support to not resume the HS channel if a radio link failure occurs, but save the RB mapping information	RB (Radio Bearer) mapping information is preserved if a high speed channel is dropped due to a radio link failure.
WINS address support primary and secondary	Primary and secondary IP addresses can be assigned for WINS (Windows Internet Name Service) name servers.
(SL8080/80B/82/84) Voice support	Analog and PCM digital
Unstructured supplementary services data (USSD)	USSD provides support for transmitting information over the GSM network signaling channels. It provides fast session-based communication between the user and an application, enabling use of text messaging, prepaid roaming, chat, etc.
(SL8080/80B/82/84) Supplementary services	Support for supplementary voice services such as Call Hold, Call Forward, Call Waiting, Multi-party Calls, Caller ID, Fixed Number Dialing, Service Dialing Numbers, etc.
Cell reselection/handover	Supports InterRat and InterFrequency cell-reselection and handover between supported frequency bands.
Security - IMEI Security	
SIM lock	The device can be 'MEP locked' to a particular PLMN.
SIM security	Both CHV1 and CHV2 are supported (unlock and unblock).

a. Not supported with the Open AT Application Framework.

7.2.1. UMTS (WCDMA) / GSM Specifications

The following table details the SL808x, SL808xT and SL808xBT modem's support for common UMTS (WCDMA) and GSM specifications.

8. Design Guidelines

This chapter provides general design guidelines for the AirPrime SL808x, SL808xT and SL808xBT module.

Caution: *This list is non-exhaustive, and the developer is responsible for deciding whether to implement these guidelines.*

For industrial assembly guidelines, refer to document [7] AirPrime SL Series Customer Process Guidelines, available from your Sierra Wireless account representative.

8.1. General Rules and Constraints

Clock and other high frequency digital signals (e.g. serial buses) should be routed as far as possible from the AirPrime SL808x, SL808xT and SL808xBT module analog signals.

If the application design makes it possible, all analog signals should be separated from digital signals by a ground line on the PCB.

Tip: *It is recommended to avoid routing any signals under the AirPrime SL808x, SL808xT and SL808xBT module on the application board.*

8.2. PCB Layout Recommendations

Ground slugs should be reflowed on to the host PCB with < 30% voiding to allow effective heat dissipation.

8.3. Power Supply

The power supply is one of the key issues in the design of a GSM terminal.

A weak power supply design could, in particular, affect:

- EMC performance
- The emission spectrum
- The phase error and frequency error

When designing the power supply, careful attention should be paid to the following:

- The quality of the power supply—low ripple, PFM or PSM systems should be avoided; linear regulation or PWM converters are preferred for low noise.
- The capacity to deliver high current peaks in a short time (pulsed radio emission).
- The VCC_3V6 line must support peak currents with an acceptable voltage drop which guarantees a minimal VCC_3V6 value of 3.3 V (lower limit of VCC_3V6)

8.4. Antenna

Another key issue in the design of a GSM terminal is the mechanical and electrical antenna adaptation. Sierra Wireless strongly recommends working with an antenna manufacturer either to develop an antenna adapted to the application or to adapt an existing solution to the application.

For more information on routing constraints for the RF circuit, see section 8.7.4 RF Circuit.

8.5. PCB Specifications for the Application Board

In order to save costs for simple applications, a cheap PCB structure can be used for the application board of the AirPrime SL808x, SL808xT and SL808xBT module. A 4-layer through-hole type PCB structure can be used.

Figure 31. PCB Structure Example for the Application Board

Note: Due to the limited layers of 4-layer PCBs, sensitive signals like audio, SIM and clocks cannot be protected by 2 adjacent ground layers. As a result, care must be taken during PCB layout for these sensitive signals by avoiding coupling to noisy baseband through adjacent layers.

8.6. Recommended PCB Landing Pattern

Refer to document [7] AirPrime SL Series Customer Process Guidelines.

8.7. Routing Constraints

8.7.1. Power Supply

Since the maximum peak current can reach 2 A, Sierra Wireless strongly recommends having a large width for the layout of the power supply signal (to avoid voltage loss between the external power supply and the AirPrime SL808x module supply).

Pins 42 and 44 of the AirPrime SL808x module should be gathered in the same piece of copper, as shown in the figure below.

Figure 32. Power Supply Routing Example

Filtering capacitors near the AirPrime SL808x, SL808xT and SL808xBT module power supply are also recommended (22 μ F to 100 μ F).

Attention should be paid to the ground track or the ground plane on the application board for the power supply which supplies the AirPrime SL808x, SL808xT and SL808xBT module. The ground track or the ground plane on the application board must support current peaks as well as with the VCC_3V6 track.

If the ground track between the AirPrime SL808x module and the power supply is a copper plane, it must not be parceled out.

The routing must be done in such a way that the total line impedance could be 10 m Ω @ 217Hz. This impedance must include the bias impedances.

The same care should be taken when routing the ground supply.

If these design rules are not followed, phase error (peak) and power loss could occur.

8.7.1.1. Ground Plane and Shielding Connection

The AirPrime SL808x, SL808xT and SL808xBT module has LGA ground pads linked to the ground. The ground has to be connected to the application board through a complete layer on the PCB.

A ground plane must be available on the application board to provide efficient connection to the bottom ground of the AirPrime SL808x module. The bottom side shielding of the AirPrime SL808x module is achieved by soldering the ground plane of the application board and the AirPrime SL808x module.

The best shielding performance is achieved when the application ground plane is a complete layer of the application PCB. To ensure good shielding of the AirPrime SL808x module, a complete ground plane layer on the application board must be available, with no tradeoffs. Connections between other ground planes should be done with vias.

Without this ground plane, external spurious TX or RX blockings could appear.

For more information, see section 8.6 Recommended PCB Landing Pattern.

8.7.2. SIM Interface

The length of the tracks between the AirPrime SL808x, SL808xT and SL808xBT module and the SIM socket should be as short as possible. Maximum recommended length is 10cm.

ESD protection is mandatory on the SIM lines if access from outside of the SIM socket is possible.

8.7.3. Audio Circuit

To get better acoustic performances, the basic recommendations are as follows:

- The speaker lines (SPK) must be routed in parallel without any wires in between
- The microphone lines (MIC) must be routed in parallel without any wires in between

All the filtering components (RLC) must be placed as close as possible to the associated MIC and SPK pins.

8.7.4. RF Circuit

The RF signal must be routed on the application board using tracks with a 50 Ω characteristic impedance.

Basically, the characteristic impedance depends on the dielectric, the track width and the ground plane spacing.

In order to respect this constraint, Sierra Wireless recommends using MicroStrip or StripLine structure and computing the Tracks width with a simulation tool (like AppCad shown in the figure below, available free of charge at <http://www.agilent.com>).

Figure 33. AppCad Screenshot for MicroStrip Design

If a multi-layered PCB is used, the RF path on the board must not cross any signal (digital, analog or supply).

If necessary, use StripLine structure and route the digital line(s) "outside" the RF structure as shown in the figure below.

Figure 34. RF Routing Examples

Stripline and Coplanar design requires having a correct ground plane at both sides. Consequently, it is necessary to add some vias along the RF path.

It is recommended to use Stripline design if the RF path is fairly long (more than 3cm), since MicroStrip design is not shielded. Consequently, the RF signal (when transmitting) may interfere with neighboring electronics (AF amplifier, etc.). In the same way, the neighboring electronics (micro-controllers, etc.) may degrade the reception performances.

The GSM/GPRS connector is intended to be directly connected to a 50 Ω antenna and no matching is needed.

8.8. EMC and ESD Recommendations

EMC tests have to be performed on the application as soon as possible to detect any potential problems.

When designing, special attention should be paid to:

- Possible spurious emissions radiated by the application to the RF receiver in the receiver band
- ESD protection is mandatory on all signals which are externally accessible · Typically, ESD protection is mandatory for the:
 - SIM (if accessible from outside)
 - Serial interface
 - USB
 - Antenna Port

The ESD diode on the antenna port is intended to prevent any degradation in RF performance. The following device is recommended for SL808x, SL808xT and SL808xBT-series modules:

Manufacturer: INPAQ Technology Co.

Part Number: EGA10402V05A2

- Length of the SIM interface lines (preferably <10 cm)
- EMC protection on audio input/output (filters against 900 MHz emissions)
- Biasing of the microphone inputs
- Ground plane: Sierra Wireless recommends a common ground plane for analog/digital/RF grounds
- A metallic case or plastic casing with conductive paint are recommended, except area around the antenna

Note: *The AirPrime SL808x, SL808xT and SL808xBT module does not include any protection against over voltage.*

The host device must provide adequate ESD protection on digital circuits and antenna ports as detailed in Table 79 ESD Specifications. See document [5] Sierra Wireless Reliability Specification for additional details.

Note: *The level of protection required depends on your application.*

Table 79. ESD Specifications

Category	Connection	Specification
Operational	RF ports	IEC-61000-4-2—Level (Electrostatic Discharge Immunity Test)
Non-operational	Host connector interface	Unless otherwise specified: • JESD22-A114 +/- 2kV Human Body Model • JESD22-A115 +/- 200V Machine Model • JESD22-C101C +/- 500V Charged Device Model
Signals	USIM connector	ESD protection is highly recommended at the point where the USIM contacts are exposed, and for any other signals that would be subjected to ESD by the user.
	Other host signals	

8.9. Mechanical Integration

Attention should be paid to:

- Antenna cable integration (bending, length, position, etc)
- Leads of the AirPrime SL808x module to be soldered to the ground plane

8.10. Operating System Upgrade

The AirPrime SL808x module's Operating System is stored in flash memory and can be easily upgraded.

Note: *In order to follow regular changes in the GPRS standard and to offer a state-of-the-art operating system, Sierra Wireless recommends that the application designed around an module (or module based product) should allow easy operating system upgrades on the module via the recommended firmware download protocol (see document [6] AirCard/AirPrime USB Driver Developer's Guide). Therefore, the application shall either allow a direct access to the module serial interface through an external connector or implement any mechanism allowing the module operating system to be downloaded.*

9. Embedded Testability

9.1. Testing Assistance Provided by Sierra Wireless

Extended AT commands have been implemented to assist with performing FTA GCF tests and portions of CE Mark tests requiring radio module access. These are documented in documents [2] AirCard/AirPrime UMTS Devices Supported AT Command Reference and [3] AirPrime MC/SL Series Extended AT Command Reference for SL808x and documents [8] AT Commands Interface Guide for Firmware 7.52 and [9] ADL User Guide for Open AT Application Framework OS 6.52 for SL808xT and SL808xBT.

Sierra Wireless offers optional professional services based assistance to OEMs with regulatory approvals.

9.2. Integration Requirements

When integrating the SL808x, SL808xT and SL808xBT module, the following items must be addressed:

- Mounting—Effect on temperature, shock, and vibration performance
- Power supply—Impact on battery drain and possible RF interference
- Antenna location and type—Impact on RF performance
- Regulatory approvals—As discussed in section 10 Certification Compliance and Recommended Standards.
- Service provisioning—Manufacturing process

Sierra Wireless provides guidelines for successful SL808x, SL808xT and SL808xBT module integration with the document suite and offers integration support services as necessary.

9.3. IOT / Operator

Interoperability and Operator/Carrier testing of the finished system is the responsibility of the OEM. The test process will be determined with the chosen network operator(s) and will be dependent upon your business relationship with them, as well as the product's application and sales channel strategy.

Sierra Wireless offers assistance to OEMs with the testing process, if required.

9.4. Module Testing Recommendations

When testing your integration design:

- Test to your worst case operating environment conditions (temperature and voltage)
- Test using worst case operation (transmitter on 100% duty cycle, maximum power)
- Monitor temperature at the location shown below—this should be the hottest spot on the device (the WCDMA PA).

Figure 35. Recommended Thermocouple Location

Note: Make sure that your system design provides sufficient cooling for the module. The RF shield temperature should be kept below 90°C when integrated to prevent damage to the module's components.

9.5. Serial Interface Access

Direct access to the UART1 serial interface is useful for:

- Testability operations
- Firmware download (for more information on firmware upgrade, see section 3.9 Firmware Upgrade)

To allow that access, the following serial interface access design is recommended:

Note 1: 1.8V supply will be required for the RS-232 interface

Note 2: DCD carried over reconfigured GPIO_1, PCM_DIN, or SPI_CS_N.
DSR carried over reconfigured GPIO_3, PCM_CLK, or SPI_DATA_MOSI.
DTR carried over reconfigured GPIO_2, PCM_DOUT, or SPI_CLK.

Note 3: RI functionality (alert host about incoming call) is provided, if needed, by using WAKE_N.

Figure 36. 8-wire Main Serial Interface (UART1) for SL808x

Figure 37. 4-wire Main Serial Interface (UART1) for SL808x, SL808xT or SL808xBT

You must provide either:

- A split-supply RS-232 transceiver. For example, Linear Technology LTC2804 or Texas Instruments TRS3253E.
- or
- A single-supply transceiver plus a level translator. For example, Analog Devices ADM3307E for the RS232 transceiver, and ST Microelectronics ST2378E for the level translator.

When it is necessary to download firmware into the AirPrime SL808x, SL808xT and SL808xBT module without going through the RS232 interface, access to the module is forced via the debug connector.

9.6. RF Output Accessibility

During the integration phase of the AirPrime SL808x module, it can be helpful to connect the AirPrime SL808x, SL808xT and SL808xBT module to a GSM/GPRS simulator in order to check critical RF TX parameters and power behavior.

Although the AirPrime SL808x module has been certified, some parameters may have degraded due to some basic precautions not having been followed (poor power supply, for example). This will not affect the functionality of the product, but the product will not comply with GSM specifications.

The following TX parameters can be checked using a GSM/GSM simulator:

- Phase & Frequency Error
- Output Power and GSM Burst Time
- Output Spectrum (Modulation and Switching)

Listed below are available typical GSM/GPRS simulators:

- CMU200 from Rhode & Schwarz
- 8960 from Agilent

Because of the high prices associated with GSM/GPRS simulators and the necessary GSM know-how to perform simulations, customers can check their applications in the Sierra Wireless laboratories. Contact the Sierra Wireless support team for more information.

10. Certification Compliance and Recommended Standards

10.1. UMTS Compliance Acceptance and Certification

The SL808x, SL808xT and SL808xBT is designed to be compliant with the 3GPP Release 5 UMTS Specification for Mobile Terminated Equipment. Final regulatory and operator certification requires regulatory agency testing and approval with the fully integrated UMTS UE host device incorporating the SL808x, SL808xT and SL808xBT module.

The OEM host device and, in particular, the OEM antenna design and implementation will affect the final product functionality, RF performance, and certification test results.

Note: Tests that require features not supported by the SL808x, SL808xT and SL808xBT (as defined by this document) are not supported.

10.2. Certification Compliance

The AirPrime SL808x, SL808xT and SL808xBT module installed on a development kit socket board application is compliant with the requirements in the following table.

Table 80. Standards Conformity for the SL808x, SL808xT and SL808xBT Module

Domain	Applicable Standard	SL8080, SL8080B, SL8080T, SL8081	SL8082, SL8082T, SL8082BT, SL8083	SL8084, SL8084T, SL8085

10.3. Applicable Standards

For queries concerning specific industry standards and certifications not described in this chapter, contact your Sierra Wireless account representative.

10.3.1. Important Notice

Because of the nature of wireless communications, transmission and reception of data can never be guaranteed. Data may be delayed, corrupted (i.e., have errors) or be totally lost. Although significant delays or losses of data are rare when wireless devices such as the Sierra Wireless modem are used in a normal manner with a well-constructed network, the Sierra Wireless modem should not be used in situations where failure to transmit or receive data could result in damage of any kind to the user or any other party, including but not limited to personal injury, death, or loss of property. Sierra Wireless and its affiliates accept no responsibility for damages of any kind resulting from delays or errors in data transmitted or received using the Sierra Wireless modem, or for failure of the Sierra Wireless modem to transmit or receive such data.

10.3.2. Safety and Hazards

Do not operate your AirPrime SL808x, SL808xT and SL808xBT module modem:

- In areas where blasting is in progress
- Where explosive atmospheres may be present including refueling points, fuel depots, and chemical plants
- Near medical equipment, life support equipment, or any equipment which may be susceptible to any form of radio interference. In such areas, the SL808x, SL808xT and SL808xBT modem **MUST BE POWERED OFF**. Otherwise, the SL808x, SL808xT and SL808xBT modem can transmit signals that could interfere with this equipment.

In an aircraft, the SL808x, SL808xT and SL808xBT modem **MUST BE POWERED OFF**. Otherwise, the SL808x, SL808xT and SL808xBT modem can transmit signals that could interfere with various onboard systems and may be dangerous to the operation of the aircraft or disrupt the cellular network. Use of a cellular phone in an aircraft is illegal in some jurisdictions. Failure to observe this instruction may lead to suspension or denial of cellular telephone services to the offender, or legal action or both.

Some airlines may permit the use of cellular phones while the aircraft is on the ground and the door is open. The SL808x, SL808xT and SL808xBT modem may be used normally at this time.

10.3.3. Important Compliance Information for North American Users

The AirPrime SL8080/SL8080B/SL8081 modules have been granted FCC (Federal Communications Commission) modular approval for use in mobile applications. Module integrators may use these devices in their final products without attaining additional FCC/IC (Industry Canada) certifications, provided they meet specific design conditions in their platform. Otherwise, additional FCC/IC approvals must be obtained.

Please contact your Sierra Wireless representative for more information.

10.3.4. EU Regulatory Conformity

Sierra Wireless hereby declares that the SL8083 modem conforms with all essential requirements of Directive 1999/5/EC.

The Declaration of Conformity made under Directive 1999/5/EC is available for viewing at the following location in the EU community:

Sierra Wireless (UK) Limited
Suite 5, the Hub
Fowler Avenue
Farnborough Business Park
Farnborough, United Kingdom GU14 7JP

11. Customization

Subject to commercial terms, Sierra Wireless can supply custom-configured modems to facilitate a carrier's network and performance requirements. Sierra Wireless also offers a standard configuration for each country.

Custom configurations are entered into a selector spreadsheet that Sierra supplies. A unique part number is assigned to each custom configuration to facilitate customer ordering.

Table 81. Customizable Features

Name	Description	Default
(SL8080/80B/82/84) Voice functionality	When enabled, supports voice calls and displays the Watcher 'voice' tab.	Enabled
MEP network locked	Mobile Equipment Personalization network locked to only allow use with specific preconfigured PLMNs (SIMs). MMI supports the entry of an unlock code subject to permanent locking feature below.	Off
MEP service provider locked		
Permanent MEP locked	Can block deactivation of MEP locked feature	Off
Roaming indicator disable ^a	Watcher never shows the onscreen roaming indicator.	Indicator enabled
Service indicator disable ^a	Watcher never shows the onscreen indicator. (For example, "HSDPA", "GPRS", "3G")	Indicator enabled
Data counter disable ^a	Watcher never shows Rx and Tx data counters.	Rx and Tx data counters enabled
Disable advanced profile menu (QoS) ^a	If disabled Watcher never shows advanced profile's QoS menus and user cannot change the minimum and requested QoS parameters.	Advance profile menu disabled
SIM PUK prompt enable	If enabled, Watcher shows the message "SIM blocked please enter PIN code".	Disabled, Watcher displays "Contact Service Provider" when SIM PIN is blocked.
GPRS attach on start-up ^a	If disabled, modem attaches when GPRS connection is required.	The modem GPRS attaches at start-up.
Disable Auto Connect	If disabled, the Auto Connect feature is blocked and cannot be enabled by the user. If blocked, the "Auto Connect" button on the profile edit menu is greyed out and cannot be selected.	The auto-connect feature menu item is enabled with the default state set to manual (not auto-connect).
Scan for profile	The modem scans through all its programmed profiles to find successful GPRS connection.	Not scanning. Only the selected profile is used for connection.
IMEI/TAC	Configured at factory to one of the following values: - Sierra Wireless IMEI - Customer-specified IMEI - No IMEI	Sierra Wireless IMEI

a. Features only available if supported in the user interface.

12. Safety Recommendations

(For Information Only)

For the efficient and safe operation of your GSM application based on the AirPrime SL808x, SL8080xT or SL808xBT module, please read the following information carefully.

12.1. RF Safety

12.1.1. General

Your GSM terminal is based on the GSM standard for cellular technology. The GSM standard is spread all over the world. It covers Europe, Asia and some parts of America and Africa. This is the most used telecommunication standard.

Your GSM terminal is actually a low power radio transmitter and receiver. It sends out as well as receives radio frequency energy. When you use your GSM application, the cellular system which handles your calls controls both the radio frequency and the power level of your cellular modem.

12.1.2. Exposure to RF Energy

There has been some public concern about possible health effects of using GSM terminals. Although research on health effects from RF energy has focused on the current RF technology for many years, scientists have begun research regarding newer radio technologies, such as GSM. After existing research had been reviewed, and after compliance to all applicable safety standards had been tested, it has been concluded that the product was fitted for use.

If you are concerned about exposure to RF energy, there are things you can do to minimize exposure. Obviously, limiting the duration of your calls will reduce your exposure to RF energy. In addition, you can reduce RF exposure by operating your cellular terminal efficiently by following the guidelines below.

12.1.3. Efficient Terminal Operation

For your GSM terminal to operate at the lowest power level, consistent with satisfactory call quality:

If your terminal has an extendable antenna, extend it fully. Some models allow you to place a call with the antenna retracted. However your GSM terminal operates more efficiently with the antenna when it is fully extended.

Do not hold the antenna when the terminal is "IN USE". Holding the antenna affects call quality and may cause the modem to operate at a higher power level than needed.

12.1.4. Antenna Care and Replacement

Do not use the GSM terminal with a damaged antenna. If a damaged antenna comes into contact with the skin, a minor burn may result. Replace a damaged antenna immediately. You may repair antenna to yourself by following the instructions provided to you. If so, use only a manufacturer-approved antenna. Otherwise, have your antenna repaired by a qualified technician.

Buy or replace the antenna only from the approved suppliers list. Using unauthorized antennas, modifications or attachments could damage the terminal and may contravene local RF emission regulations or invalidate type approval.

12.2. General Safety

12.2.1. Driving

Check the laws and the regulations regarding the use of cellular devices in the area where you have to drive as you always have to comply with them. When using your GSM terminal while driving, please:

- give full attention to driving,
- pull off the road and park before making or answering a call if driving conditions so require.

12.2.2. Electronic Devices

Most electronic equipment, for example in hospitals and motor vehicles is shielded from RF energy. However, RF energy may affect some improperly shielded electronic equipment.

12.2.3. Vehicle Electronic Equipment

Check with your vehicle manufacturer representative to determine if any on-board electronic equipment is adequately shielded from RF energy.

12.2.4. Medical Electronic Equipment

Consult the manufacturer of any personal medical devices (such as pacemakers, hearing aids, etc...) to determine if they are adequately shielded from external RF energy.

Turn your terminal OFF in health care facilities when any regulations posted in the area instruct you to do so. Hospitals or health care facilities may be using RF monitoring equipment.

12.2.5. Aircraft

Turn your terminal OFF before boarding any aircraft.

- Use it on the ground only with crew permission.
- Do not use it in the air.

To prevent possible interference with aircraft systems, Federal Aviation Administration (FAA) regulations require you should have prior permission from a crew member to use your terminal while the aircraft is on the ground. To prevent interference with cellular systems, local RF regulations prohibit using your modem while airborne.

12.2.6. Children

Do not allow children to play with your GSM terminal. It is not a toy. Children could hurt themselves or others (by poking themselves or others in the eye with the antenna, for example). Children could damage the modem, or make calls that increase your modem bills.

12.2.7. Blasting Areas

To avoid interfering with blasting operations, turn your unit OFF when you are in a "blasting area" or in areas posted: "turn off two-way radio". Construction crew often uses remote control RF devices to set off explosives.

12.2.8. Potentially Explosive Atmospheres

Turn your terminal OFF when in any area with a potentially explosive atmosphere. Though it is rare, but your modem or its accessories could generate sparks. Sparks in such areas could cause an explosion or fire resulting in bodily injuries or even death.

Areas with a potentially explosive atmosphere are often, but not always, clearly marked. They include fuelling areas such as petrol stations; below decks on boats; fuel or chemical transfer or storage facilities; and areas where the air contains chemicals or particles, such as grain, dust, or metal powders.

Do not transport or store flammable gas, liquid, or explosives, in the compartment of your vehicle which contains your terminal or accessories.

Before using your terminal in a vehicle powered by liquefied petroleum gas (such as propane or butane) ensure that the vehicle complies with the relevant fire and safety regulations of the country in which the vehicle is used.

13. Connector and Peripheral Device References

13.1. JTAG Connector

Sierra Wireless suggests that a MOLEX ZIF connector (MFG#: 0513741072) be applied to your design to enable debugging/testing of devices by Sierra Wireless in the event of platform issues (see <http://www.molex.com>).

14. Signal Reference Schematics

USB Interface

SIM Interface

JTAG Interface

A smaller JTAG connector is recommended in the PTS

- [9] ADL User Guide for Open AT Application Framework OS 6.52
Reference: 4111844

15.2.2. Industry / Other Documents

The following non-Sierra Wireless references are not included in your documentation package:

- [10] Universal Serial Bus Specification, Rev 2.0
- [11] 3GPP TS 34.108

15.3. Abbreviations / Acronyms

Table 82. List of Abbreviations / Acronyms

Abbreviation	Definition
3GPP	3rd Generation Partnership Project
A-GPS	Assisted GPS
API	Application Programming Interface
AT	Attention (prefix for modem commands)
CHAP	Challenge Handshake Authentication Protocol
CnS	Control and Status (Sierra Wireless' proprietary host interface protocol)
CPHS	Common PCN Handset Specification
CS	Circuit-switched
CSD	Circuit-switched Data
DHCP	Dynamic Host Configuration Protocol
DUN	Dial-Up Networking
EAP-SIM	Extensible Authentication Protocol Method for GSM Subscriber Identity
EDGE	Enhanced Data rates for GSM Evolution
EFR	Enhanced Full Rate
EONS	Enhanced Operator Name String
eSIM	embedded SIM
FR	Full Rate
GPRS	General Packet Radio Service
GPS	Global Positioning System
GSM	Global System for Mobile Communications
HPLMN	Home PLMN
HR	Half Rate
HSDPA	High Speed Downlink Packet Access
IMSI	International Mobile Subscriber Identity
LGA	Land Grid Array
MO	Modem Originated
MT	Modem Terminated
NDIS	Network Driver Interface Specification
NIC	Network Interface Card
NMEA	National Marine Electronics Association
PAP	Password Authentication Protocol
PC/SC	PC / Smart Card
PDP	Packet Data Protocol
PLMN	Public Land Mobile Network

Abbreviation	Definition
PS	Packet-switched
QoS	Quality of Service
RF	Radio Frequency
RTC	Real Time Clock
Rx	Receive
SDK	Software Development Kit
SIM	Subscriber Identity Module
SMS	Short Message Service
TDD	Telecommunications Device for the Deaf
TTY	Teletypewriter
Tx	Transmit
UMTS	Universal Mobile Telecommunications System
USB	Universal Serial Bus
USIM	Universal Subscriber Identity Module (UMTS)
USSD	Unstructured Supplementary Services Data
VCC	Collector Common Voltage
WCDMA	Wideband Code Division Multiple Access
